IOM NPM regularly and systematically captures, monitors and disseminates information regarding the movements and evolving needs of populations on the move, whether on site or en route. NPM's monthly site assessment rounds capture the numbers, locations and key sectoral needs of Rohingya refugees in the area affected by the influx since 25 August 2017. Data is collected through key informant interviews and direct observation.

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *mahjee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

IOM NPM regularly and systematically captures, monitors and disseminates information regarding the movements and evolving needs of populations on the move, whether on site or en route. NPM's monthly site assessment rounds capture the numbers, locations and key sectoral needs of Rohingya refugees in the area affected by the influx since 25 August 2017. Data is collected through key informant interviews and direct observation.

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *mahjee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

Site Profiling
Round 1

UNHCR The UN Refugee Agency

REACH An initiative of IMPACT Initiatives ACTED and UNOSAT

Introduction

This profile provides a multisector overview of conditions in Zone AA, Ukhiya, Cox's Bazar District. Data for the findings were collected on 21 November 2017 as part of the Site Profiling exercise, implemented by REACH and supported by the UNHCR. Key indicators have been analyzed and are presented in this annex to the NPM Site Profiles factsheet in order to provide further context and operational findings at the household level.

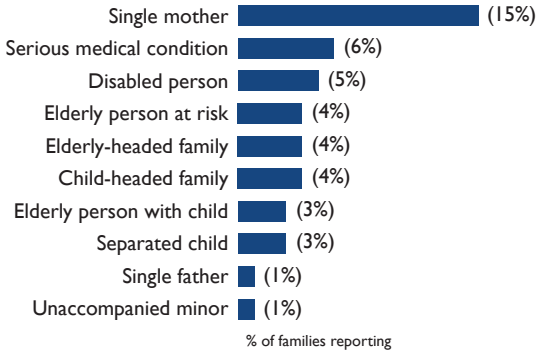
Primary data were collected through household surveys of families who have arrived since 25 August 2017, randomly sampled from the UNHCR October 2017 Family Count dataset. The sampling was designed so that findings are generalizable at the zone level with at least a 95% confidence level and a 10% margin of error. In Kutupalong MS, 132 families were surveyed.

Data for the introductory Overall Demographics and Specific Needs section are taken from the Family Count provided by UNHCR and presented in order to provide a strong protection context for the household-level findings in the profile.

This factsheet specifically looks at conditions for those families that arrived after 25 August 2017. A date of arrival graph, based on Family Count numbers, is included in the introductory section to contextualize this.

Overall Demographics and Specific Needs

Families with specific needs*



Families identified with a vulnerability

31%

of families

*Figures in the above graph are the percentages of families with at least one person in the family with the specific need. More than one specific need may be present within one family.

Age and gender distribution

*Numbers are rounded to the nearest hundred.

Average household size
4.6

IOM NPM regularly and systematically captures, monitors and disseminates information regarding the movements and evolving needs of populations on the move, whether on site or en route. NPM's monthly site assessment rounds capture the numbers, locations and key sectoral needs of Rohingya refugees in the area affected by the influx since 25 August 2017. Data is collected through key informant interviews and direct observation.

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *mahjee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

Site Profiling
Round 1

UNHCR The UN Refugee Agency

REACH An initiative of IMPACT Initiatives ACTED and UNOSAT

Introduction

This profile provides a multisector overview of conditions in Zone AA, Ukhiya, Cox's Bazar District. Data for the findings were collected on 19 November 2017 as part of the Site Profiling exercise, implemented by REACH and supported by the UNHCR. Key indicators have been analyzed and are presented in this annex to the NPM Site Profiles factsheet in order to provide further context and operational findings at the household level.

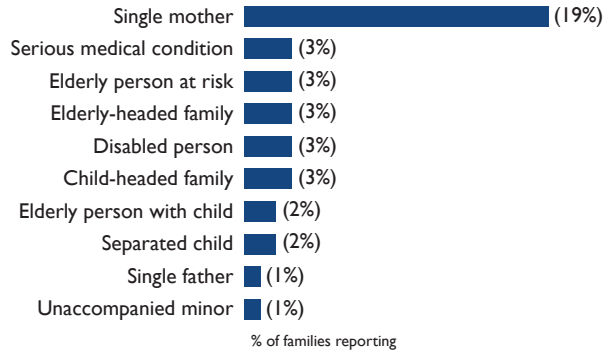
Primary data were collected through household surveys of families who have arrived since 25 August 2017, randomly sampled from the UNHCR October 2017 Family Count dataset. The sampling was designed so that findings are generalizable at the zone level with at least a 95% confidence level and a 10% margin of error. In Zone AA, 126 families were surveyed.

Data for the introductory Overall Demographics and Specific Needs section are taken from the Family Count provided by UNHCR and presented in order to provide a strong protection context for the household-level findings in the profile.

This factsheet specifically looks at conditions for those families that arrived after 25 August 2017. A date of arrival graph, based on Family Count numbers, is included in the introductory section to contextualize this.

Overall Demographics and Specific Needs

Families with specific needs*



Families identified with a vulnerability

31%

of families

*Figures in the above graph are the percentages of families with at least one person in the family with the specific need. More than one specific need may be present within one family.

Age and gender distribution

Households*
6400

*Numbers are rounded to the nearest hundred.

Average household size
4.3

IOM NPM regularly and systematically captures, monitors and disseminates information regarding the movements and evolving needs of populations on the move, whether on site or en route. NPM's monthly site assessment rounds capture the numbers, locations and key sectoral needs of Rohingya refugees in the area affected by the influx since 25 August 2017. Data is collected through key informant interviews and direct observation.

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *majhee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

Site Profiling
Round 1

UNHCR The UN Refugee Agency

REACH An initiative of IMPACT Initiatives ACTED and UNOSAT

Introduction

This profile provides a multisector overview of conditions in Zone AA, Ukhiya, Cox's Bazar District. Data for the findings were collected on 14 November 2017 as part of the Site Profiling exercise, implemented by REACH and supported by the UNHCR. Key indicators have been analyzed and are presented in this annex to the NPM Site Profiles factsheet in order to provide further context and operational findings at the household level.

Primary data were collected through household surveys of families who have arrived since 25 August 2017, randomly sampled from the UNHCR October 2017 Family Count dataset. The sampling was designed so that findings are generalizable at the zone level with at least a 95% confidence level and a 10% margin of error. In Zone BB, 97 families were surveyed.

Data for the introductory Overall Demographics and Specific Needs section are taken from the Family Count provided by UNHCR and presented in order to provide a strong protection context for the household-level findings in the profile.

This factsheet specifically looks at conditions for those families that arrived after 25 August 2017. A date of arrival graph, based on Family Count numbers, is included in the introductory section to contextualize this.

IOM NPM regularly and systematically captures, monitors and disseminates information regarding the movements and evolving needs of populations on the move, whether on site or en route. NPM's monthly site assessment rounds capture the numbers, locations and key sectoral needs of Rohingya refugees in the area affected by the influx since 25 August 2017. Data is collected through key informant interviews and direct observation.

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *majhee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

Site Profiling
Round 1

UNHCR The UN Refugee Agency

REACH An initiative of IMPACT Initiatives ACTED and UNOSAT

Introduction

This profile provides a multisector overview of conditions in Zone AA, Ukhiya, Cox's Bazar District. Data for the findings were collected on 16 November 2017 as part of the Site Profiling exercise, implemented by REACH and supported by the UNHCR. Key indicators have been analyzed and are presented in this annex to the NPM Site Profiles factsheet in order to provide further context and operational findings at the household level.

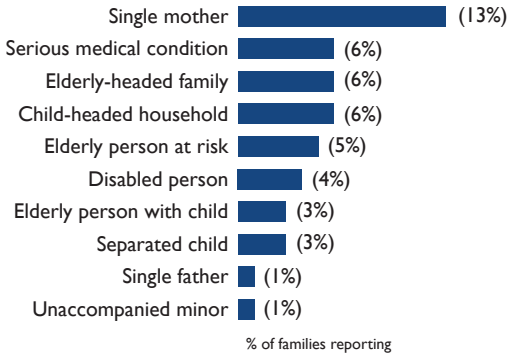
Primary data were collected through household surveys of families who have arrived since 25 August 2017, randomly sampled from the UNHCR October 2017 Family Count dataset. The sampling was designed so that findings are generalizable at the zone level with at least a 95% confidence level and a 10% margin of error. In Zone FF, 129 families were surveyed.

Data for the introductory Overall Demographics and Specific Needs section are taken from the Family Count provided by UNHCR and presented in order to provide a strong protection context for the household-level findings in the profile.

This factsheet specifically looks at conditions for those families that arrived after 25 August 2017. A date of arrival graph, based on Family Count numbers, is included in the introductory section to contextualize this.

Overall Demographics and Specific Needs

Families with specific needs*



Families identified with a vulnerability

The unit of data collection depends on the setting. In the Makeshift Sites and their Expansions it is a 'block,' defined as an area of responsibility of one *mahjee*, usually around 100 households. The blocks are not always spatially contiguous and may have gaps. In the villages it is the village itself, and in towns it is a refugee community, typically smaller than 100 households, although with a few exceptions.

On these Site Profiles all these units are collectively called 'locations'. The data is aggregated up to the zone level in the sites and camps and to the upazila level outside of them. For more information on the NPM methodology please contact dtmbangladesh@iom.int.

Site Profiling
Round 1

UNHCR The UN Refugee Agency

REACH An initiative of IMPACT Initiatives ACTED and UNOSAT

Introduction

This profile provides a multisector overview of conditions in Zone AA, Ukhiya, Cox's Bazar District. Data for the findings were collected on 22 November 2017 as part of the Site Profiling exercise, implemented by REACH and supported by the UNHCR. Key indicators have been analyzed and are presented in this annex to the NPM Site Profiles factsheet in order to provide further context and operational findings at the household level.

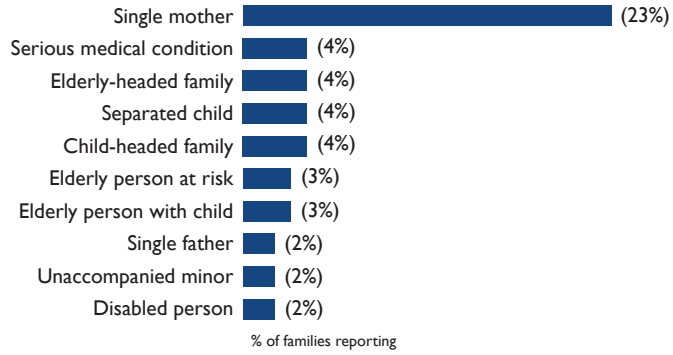
Primary data were collected through household surveys of families who have arrived since 25 August 2017, randomly sampled from the UNHCR October 2017 Family Count dataset. The sampling was designed so that findings are generalizable at the zone level with at least a 95% confidence level and a 10% margin of error. In Zone OO, 127 families were surveyed.

Data for the introductory Overall Demographics and Specific Needs section are taken from the Family Count provided by UNHCR and presented in order to provide a strong protection context for the household-level findings in the profile.

This factsheet specifically looks at conditions for those families that arrived after 25 August 2017. A date of arrival graph, based on Family Count numbers, is included in the introductory section to contextualize this.

Overall Demographics and Specific Needs

Families with specific needs*



Families identified with a vulnerability

37%

of families

*Figures in the above graph are the percentages of families with at least one person in the family with the specific need. More than one specific need may be present within one family.

Age and gender distribution
