

Central African Republic

IDP RETURN INTENTION SURVEY IN BANGUI

June 2014

International Organization for Migration

SUMMARY

As part of its implementation of the Displacement Tracking Matrix (DTM), the International Organization for Migration (IOM) conducted the sixth Internally Displaced Person (IDP) Return Intention Survey in Bangui, Central African Republic (CAR) from **17-19 June 2014**. IOM site facilitators interviewed a sample of **601 displaced persons at 31 sites in Bangui**. This survey follows the fifth Return Intention Survey conducted in May 2014.

This report presents the following main results:

DISPLACEMENT

86% of displaced persons left their place of origin in December 2013.

11% of displaced persons have stayed at more than one spontaneous displacement site.

RETURN INTENTIONS

56% of displaced persons indicated their intention to return to their place of origin within the next four weeks. In comparison to the previous survey findings, there is a slight decrease in intentions to return. In comparison, 74% indicated an intention to return in the first survey, 66% in the second survey, 58% in the third, 57% in the fourth and 60% in the fifth.

36% of displaced persons indicated their intention to remain at their displacement site. In comparison to previous survey findings, this represents an increase (from 27% in May 2014) in the percentage of displaced persons intending to remain at their displacement site. The increase may be related to security incidents which occurred in the weeks before the survey, especially in the 3rd and 5th districts.

Reasons preventing displaced people from returning to their place of origin are:

- Belongings stolen (74%)
- Absence of authorities (68%)
- No financial means to return (66%)
- Do not feel safe (66%)

NEEDS

Compared with the previous survey, IDPs primary needs to facilitate their return remain almost in the same order. Security is the highest priority (33%) followed by housing (31%) and non-food items (13%).

92% of displaced persons experienced interruption of professional activities due to displacement.

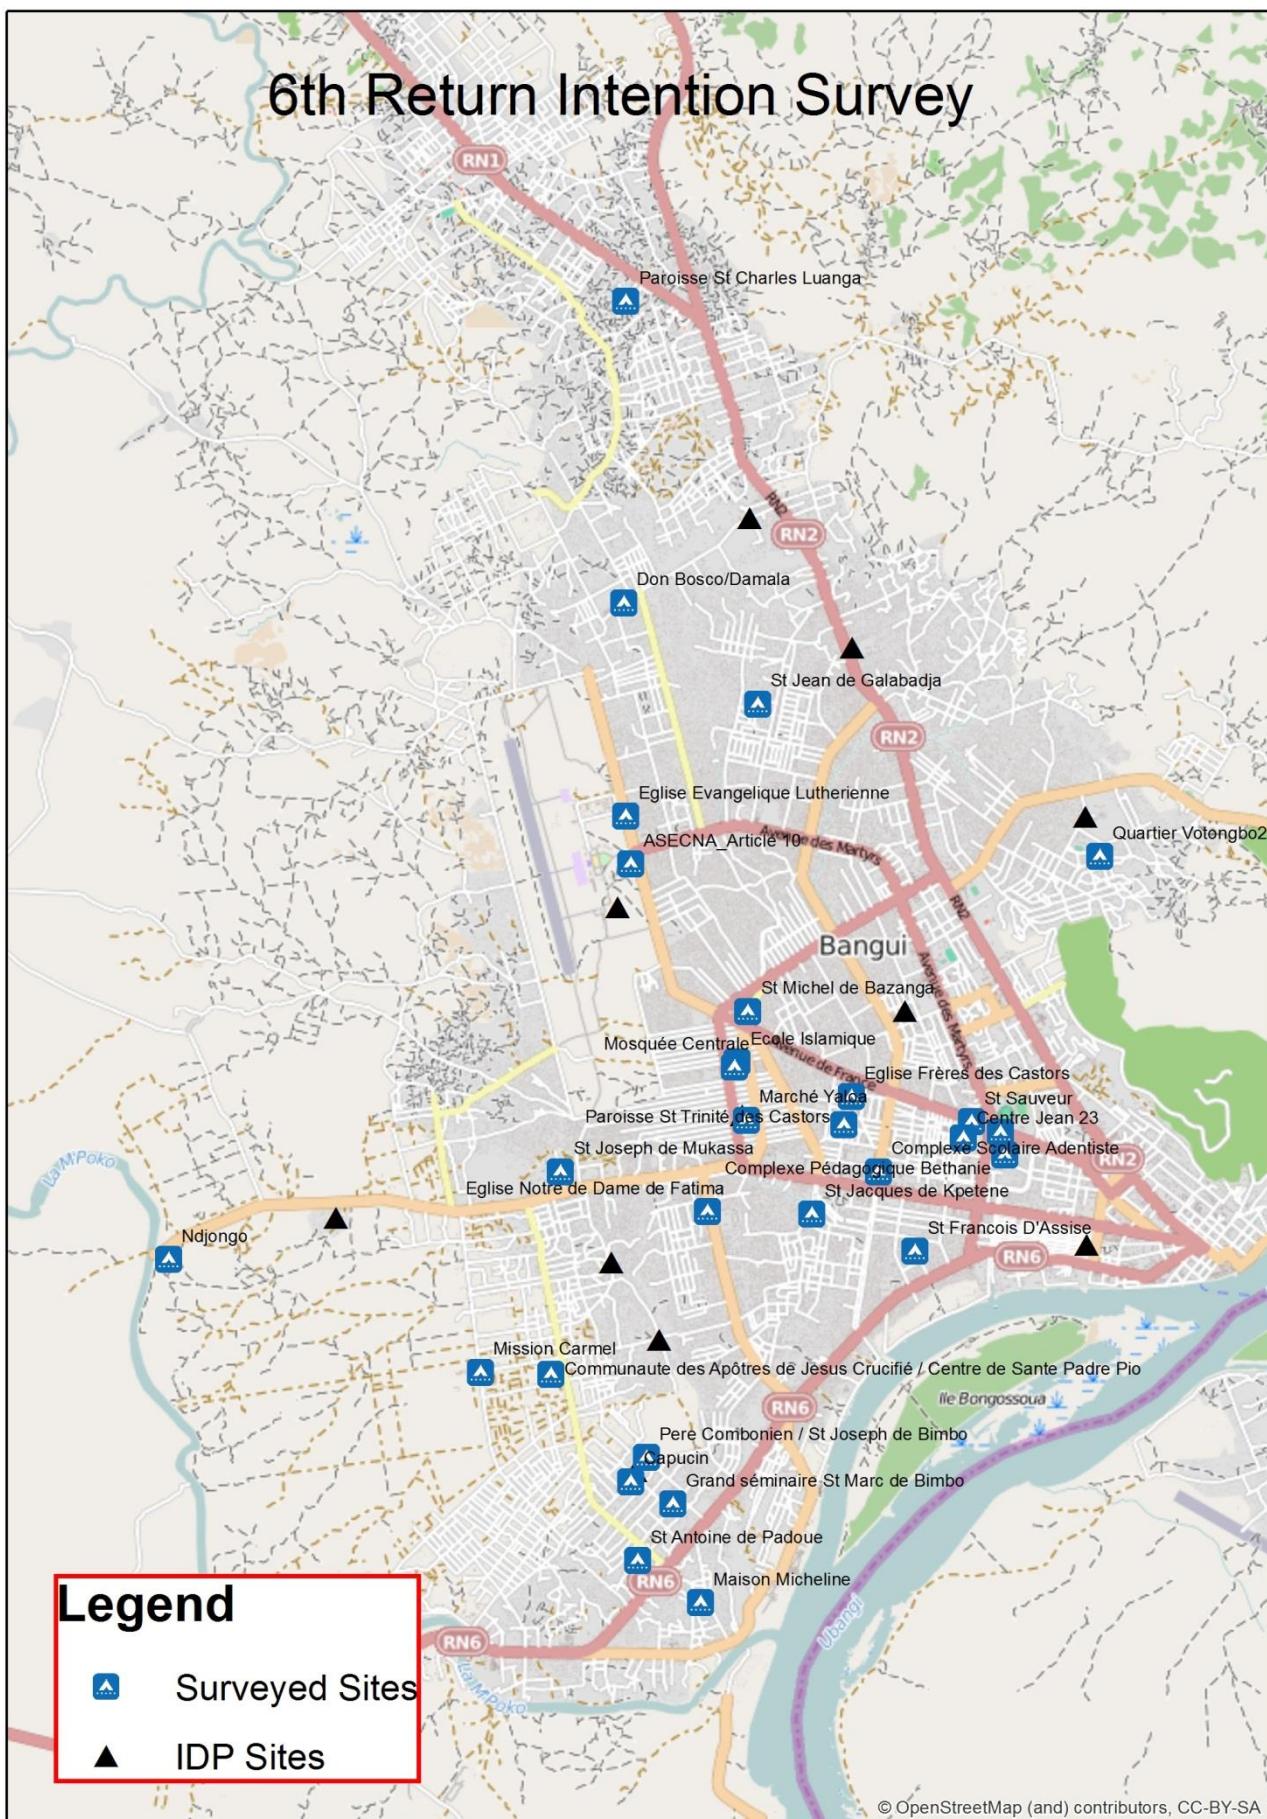

62% anticipate resumption of professional activities upon their return.

Food continues to be a critical issue: 97% reported a reduction in the number of meals per day, 97% a reduction in family member's food consumption and 89% a reduction in adults' food consumption to feed children.

ILLUSTRATIVE MAP OF SURVEYED IDP SITES

1. INTRODUCTION

The total number of displaced people in Bangui continues to decrease. According to the “Commission des Mouvements des Populations” since the last survey there are 18,000 fewer IDPs in the sites (from 135,943 to 117,379). Intention to return remains high (56%) and returns are mainly prevented by lack of presence of authorities and the loss of belongings during the displacement. 86% of the remaining 117,379 displaced persons in 44 spontaneous displacement sites in Bangui have been displaced since December 2013.

Absence of authorities, general insecurity and lack of financial means are the main factors preventing the return of the population to the neighborhoods of origin. The re-establishment of general services is considered closely linked with the return process. This month interviewees reported decreased access to public services, including schools, health services, and markets. The reported presence of police and military has also declined.

2. METHODOLOGY

IOM’s DTM contributes to the tracking and monitoring of the displaced populations to assist in the prioritization of humanitarian aid. In CAR, IOM is implementing the DTM in partnership with local NGOs (AFPE, AIDE, IDEAL and JUPEDEC). 30 Site facilitators regularly collect information on the displacement situation. This activity has been focused on the displacement sites around Bangui and recently extended to the prefecture of Boda in Lobaye. IOM compiles and disseminates this information to humanitarian organizations in order to focus the planning and the delivery of humanitarian assistance to displaced populations.

During daily visits to the sites, facilitators conducted the return intention survey questionnaire as part of the DTM (annex A). The exercise was conducted at 31 IDP sites in Bangui, randomly selected from 17-19 June 2014. A total of 601 persons were interviewed. Interviewees were chosen randomly from the IDP population living in the displacement sites in Bangui. Displaced persons consented to participate after being informed of survey intentions and the principles of voluntary participation. Interviews took place between 9am-4pm Tuesday to Thursday. Some sites are frequented mainly at night and are almost empty during the day when some of the population commutes to farms and some pursue daily labor. The data could be affected by these activity patterns.

Using an interval of confidence of 95% on a total population of 117,379 individuals, the margin of error of the data is estimated to be 4%.

3. RESULTS

This section presents the main findings of the survey:

3A. SURVEY DEMOGRAPHIC DATA

601 displaced persons responded to the questionnaire, each representing one household, and representing a total population of 5,051 displaced individuals, according to interviewees' self-reported family size. As shown in Chart 1, 35% of the surveyed participants were male and 65% were female. Interviews were conducted during daytime, and as result, the proportion of females was high since most of the men were out of the sites during day. Most of the respondents were aged 26-40 (39%) and 41-60 (37%).

CHART 1: SURVEY PARTICIPANTS BY SEX

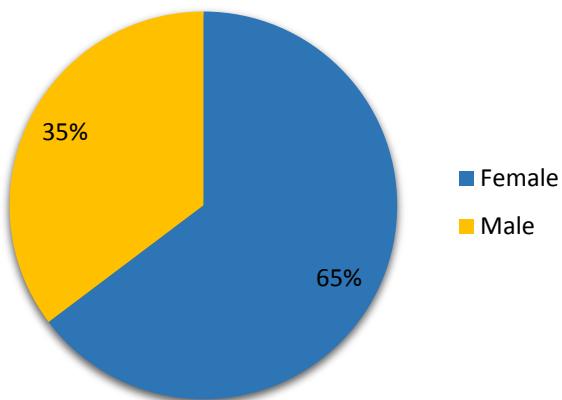

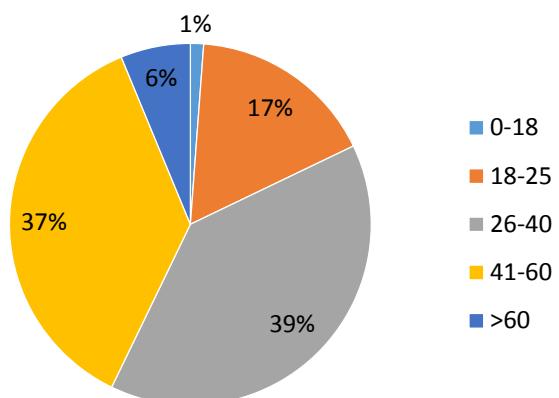

CHART 2: SURVEY PARTICIPANTS BY AGE GROUP

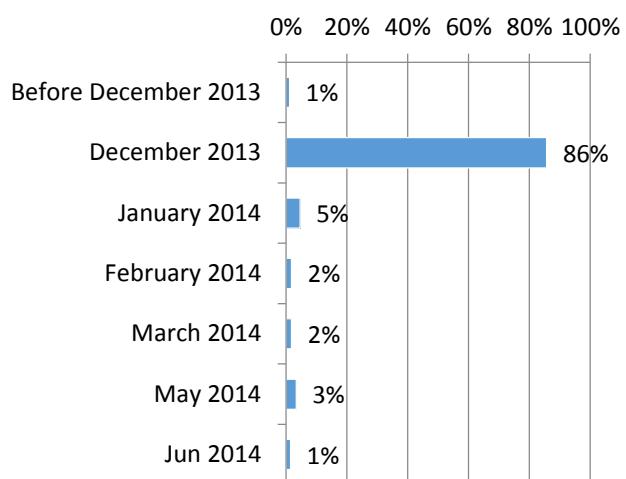

3B. DISPLACEMENT AND CONDITIONS OF DISPLACEMENTS

This section looks at the profile of the displacement and the survival mechanisms of the displaced population.

As shown in Chart 3, the majority of the displaced population surveyed i.e. (86%) left their place of origin in December 2013; 5% left in January; 2% in February; and a small portion of the population left their residence in March 2014 (2%), 3% in May 2014 and 1% in June.

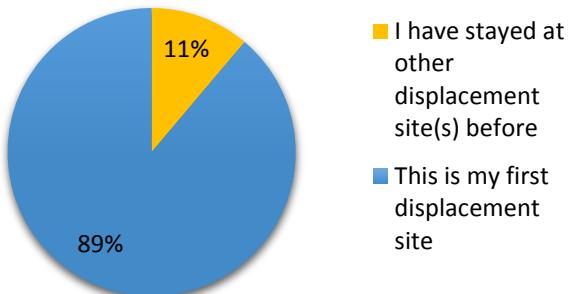

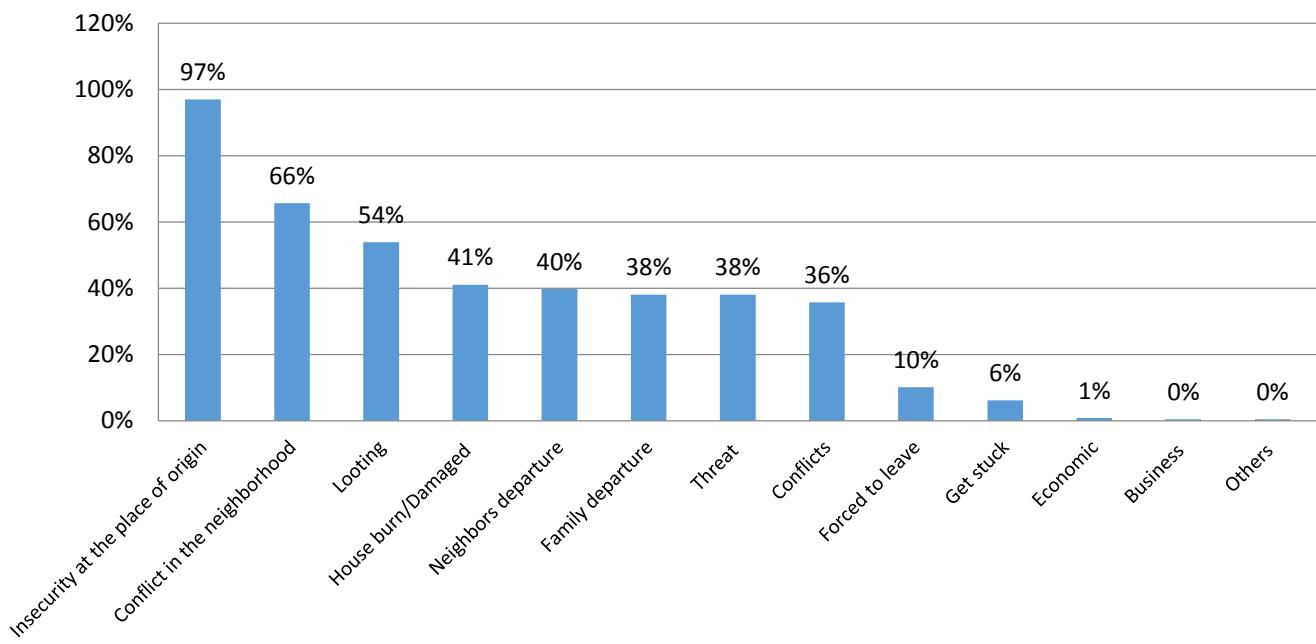

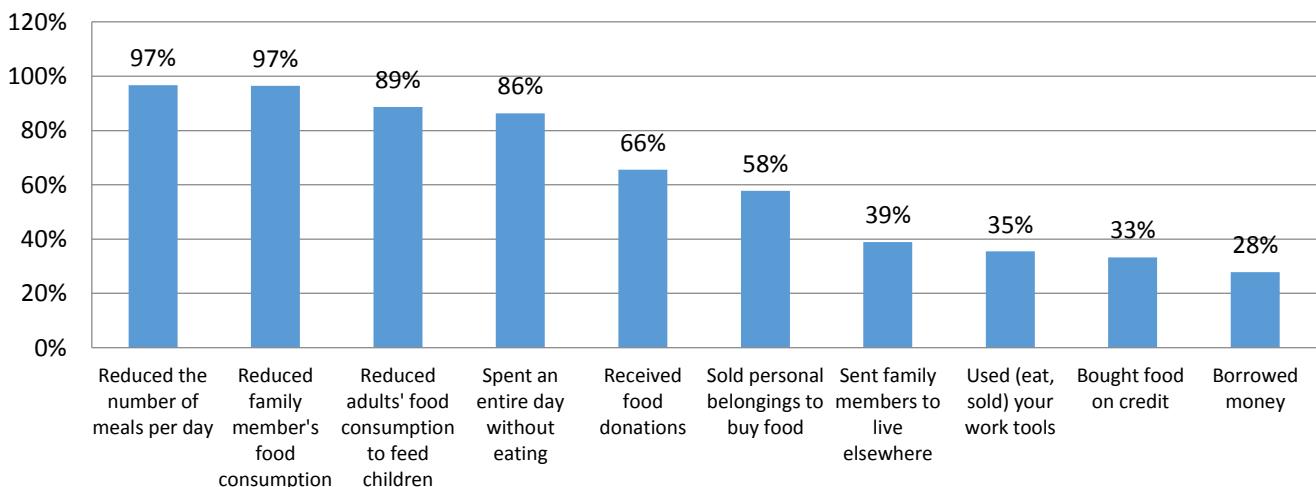

This chart suggests that the current displacement is closely linked to the movements caused by the beginning of the crisis in December 2013. Those apparently staying in the sites are those who moved immediately after the crisis in December 2013 and lost their belongings with currently no means to recover them or no means to restart their livelihoods.

Chart 3: Time of the start of the displacement

The percentage of the displaced population that moved from one displacement site to another decreased from 14% in the previous survey to 11% (Chart 4).

Chart 5 below shows that 97% of the respondents listed insecurity in their place of origin as the main reason for displacement followed by conflict in their neighborhood (66%). Other reasons for displacement include looting (54%) and home damages (41%).

CHART 4: Chronology of displacement**CHART 5: Reasons for displacement****CHART 6: Survival mechanisms (past 2 weeks)**

The survey, also examined the survival mechanisms of the displaced population over the two weeks prior to the survey as shown in Chart 6 (previous page). It was found that most of the displaced population i.e. 97% reduced the number of meals per day and family members' food consumption for survival. Other survival mechanisms included reducing adults' food consumption to feed children (89%). Among the respondents, 86% spent at least one entire day without eating. 58% sold their belongings to buy food, 33% (one in three respondents) bought food on credit and 28% borrowed money. These responses illustrate the economic crisis looming behind the acute humanitarian crisis experienced in these months by the displaced population of Bangui.

3C. RETURN INTENTIONS

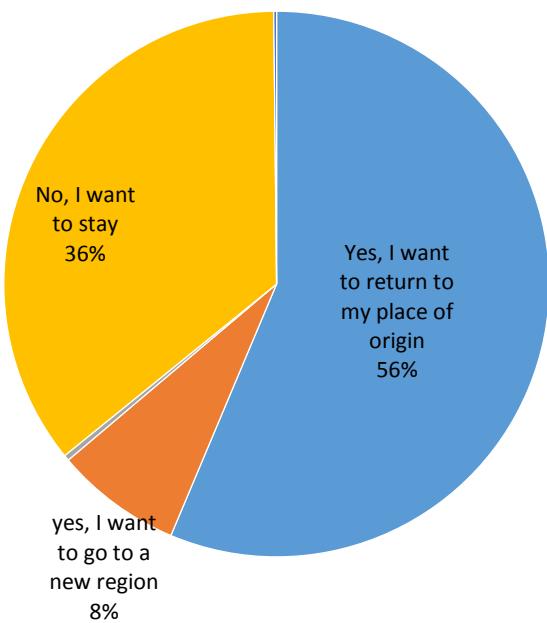

This section explores the intentions of the displaced population to return to their communities of origin. The questions intend to set a realistic timeframe and allow the population to reflect not only on their own immediate return intentions, but to also reflect on the indicators necessary to allow for return.

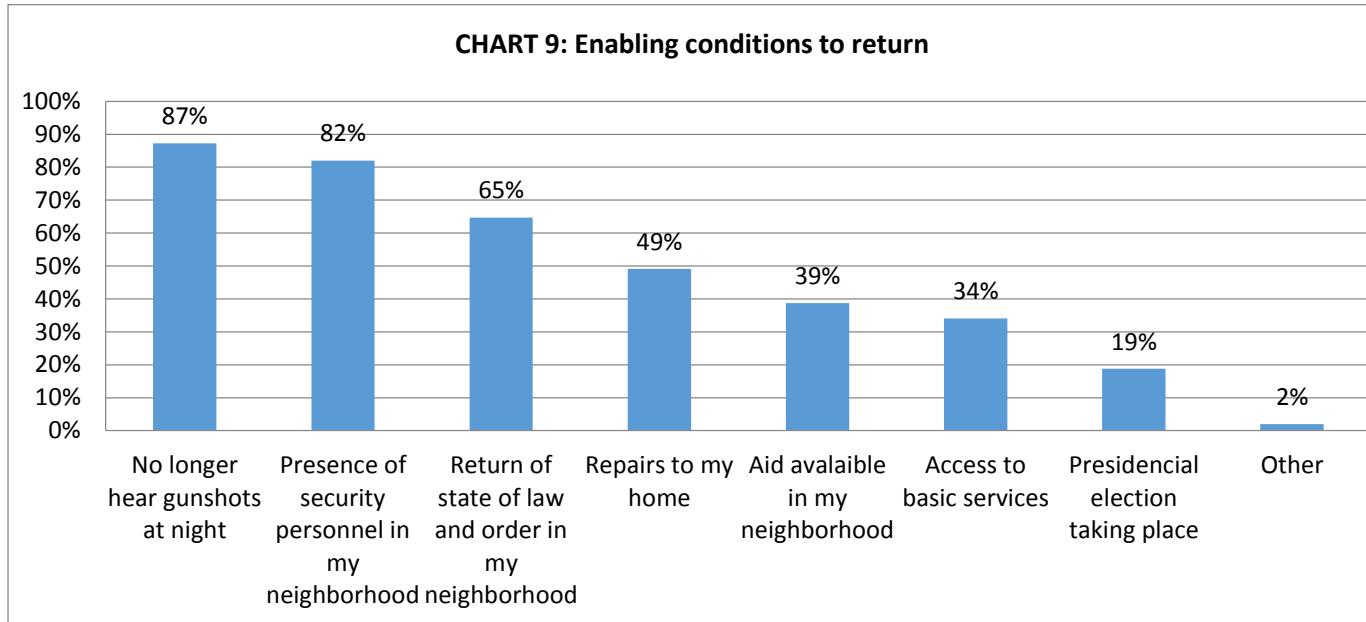

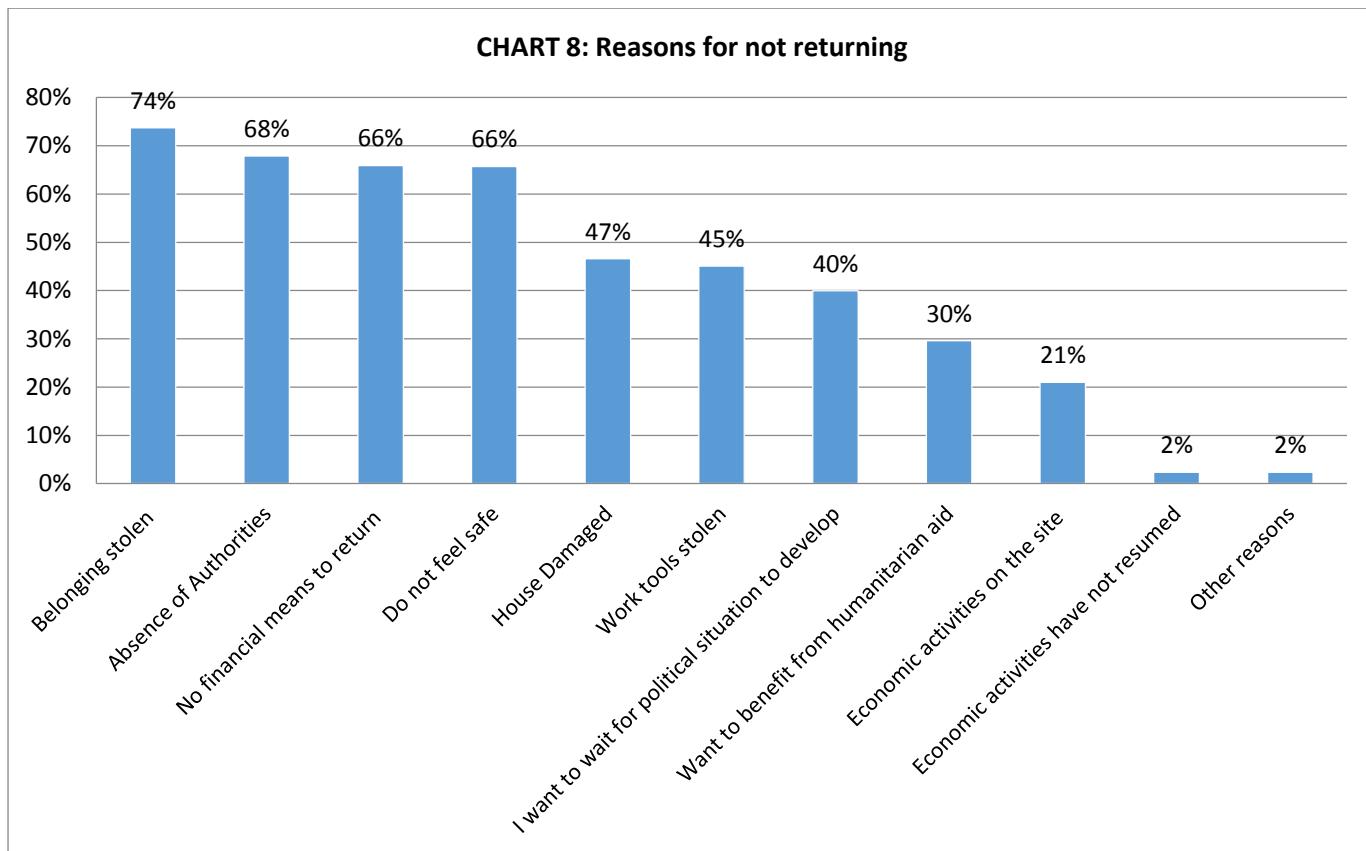

Chart 7 shows that 56% of the IDPs intend to return to their places of origin, while 36% intend to stay in the displacement sites.

Stolen belongings (74%) is the primary reason for not having returned, followed by absence of authorities (68%) and no financial means (66%) as shown in Chart 8.

Among other responses, 30% of respondents indicate that they do not intend to return because they want to benefit from the humanitarian aid provided at the displacement site. This is a useful indication for humanitarian assistance providers: 30% of IDPs will have one fewer reason to stay with aid distributed in the neighborhoods instead of the sites. In absolute numbers, using our sample, this means that approximately 32,000 may not prolong their stay in the sites if humanitarian aid was provided in the areas of return.

CHART 7: RETURN INTENTION IN THE NEXT 4 WEEKS

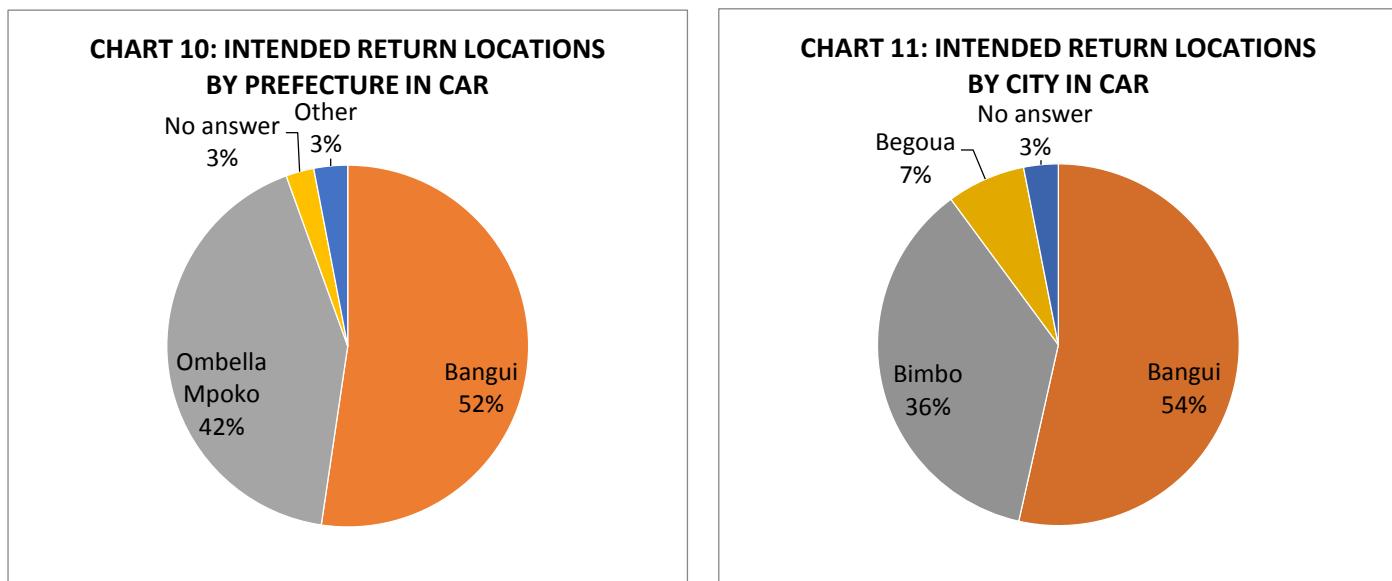

Some of the conditions that will enable the return of the IDPs are: no longer hearing gunshots at night (87%) and ensuring security personnel in their neighbourhoods (82%).

Chart 9 in addition indicates the composition of the main factors for facilitating a durable return: security first, then return of state of law and order, and house repairs. Working on these main pillars would pave the way for returns.

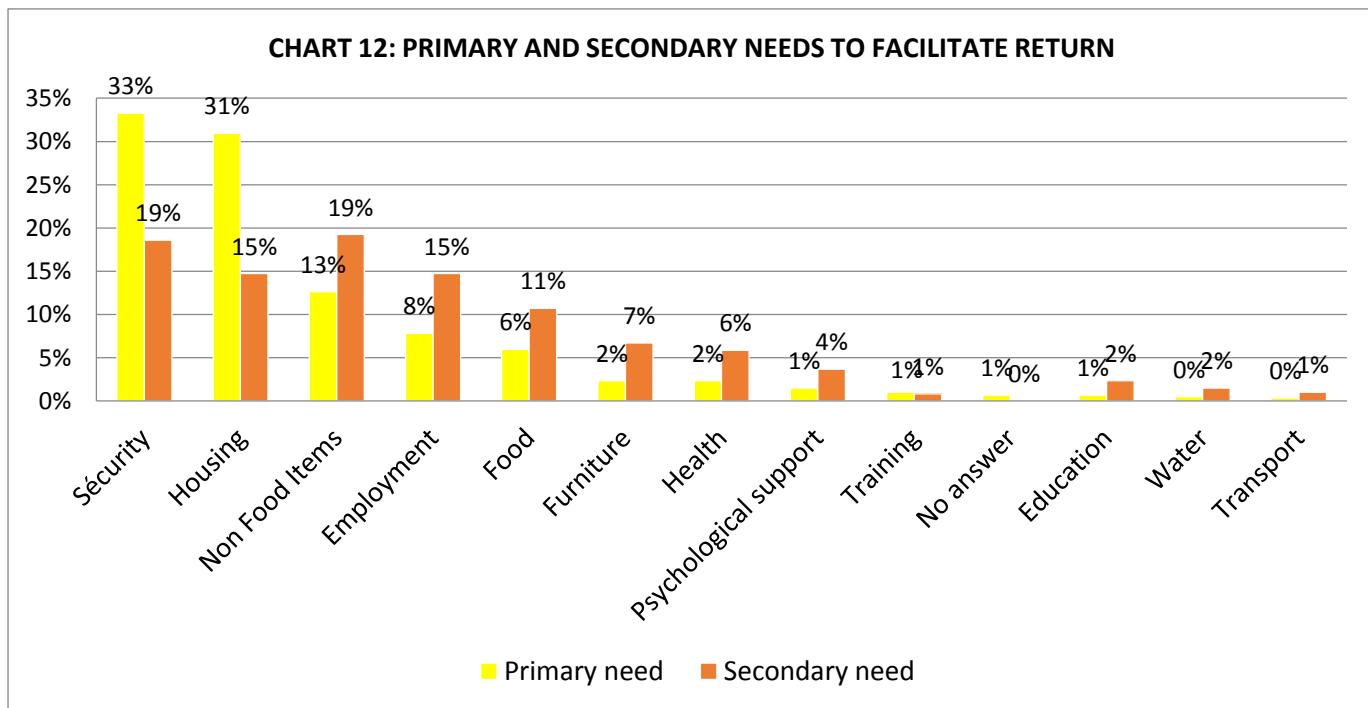

Charts 10 and 11 below show the locations, by prefecture and city, of intended returns. Bangui and Ombella Mpoko are the main destinations by prefecture while Bangui, Bimbo and Begoua are the main intended cities of return.

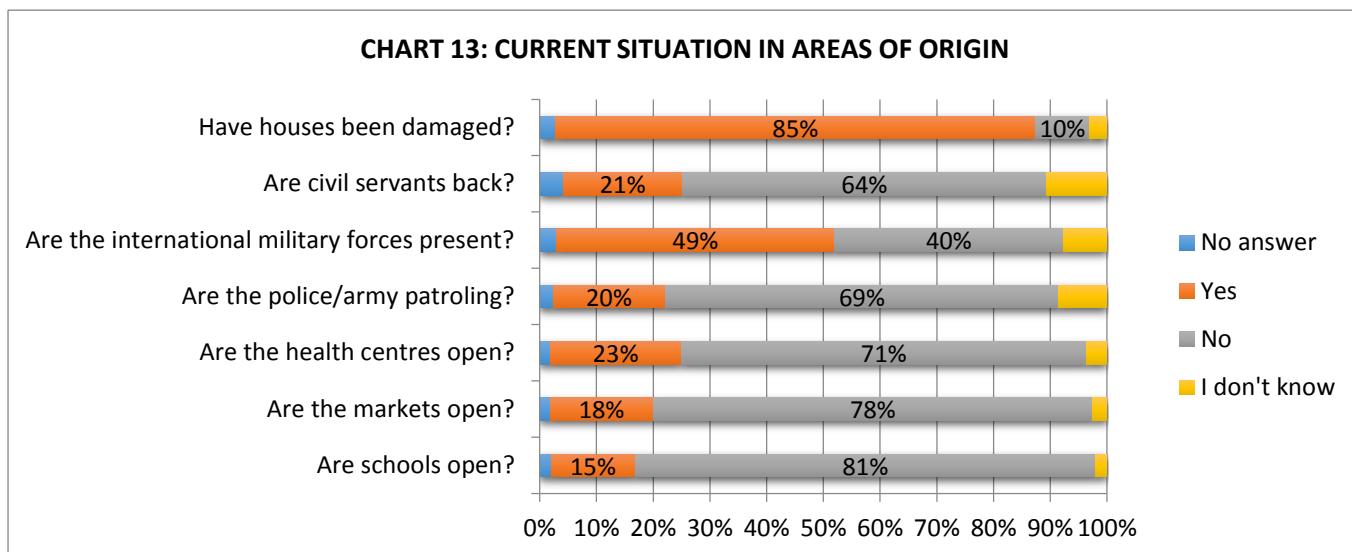

3D. NEEDS

This section identifies the primary and secondary needs to facilitate IDPs' return process to their places of origin.

Chart 12 shows the disaggregated response of the IDPs primary and secondary needs. Security, housing and non-food items, in this order, are the primary needs identified to facilitate the return of IDPs to their neighborhoods of origin. The same needs are also listed as secondary needs with employment and food having been indicated as well by 15% and 11% respectively. Other options including transport, water, training, psychological support and health have been indicated only marginally, with percentages between 0 and 6%.

In comparison to the previous survey, Chart 13 shows that IDPs' perception of the availability of services in their areas of origin has decreased. The percent of respondents who reported that markets are open has decreased from 39% to 18%. Reported availability of public services has also declined, including schools (decrease of 20% to 15%), health centres (decrease of 39% to 23%), and presence of civil servants (decrease of 32% to 21%). The reported presence of international military forces also decreased from 57% to 49%; as well as reported police/army patrols (decrease of 25% to 20%).

As shown in chart 14, 92% indicated that their regular income generating activities had been interrupted. Those who believed that they would be able to return to their regular income generating activity increased from 59% in the previous survey to 62%.

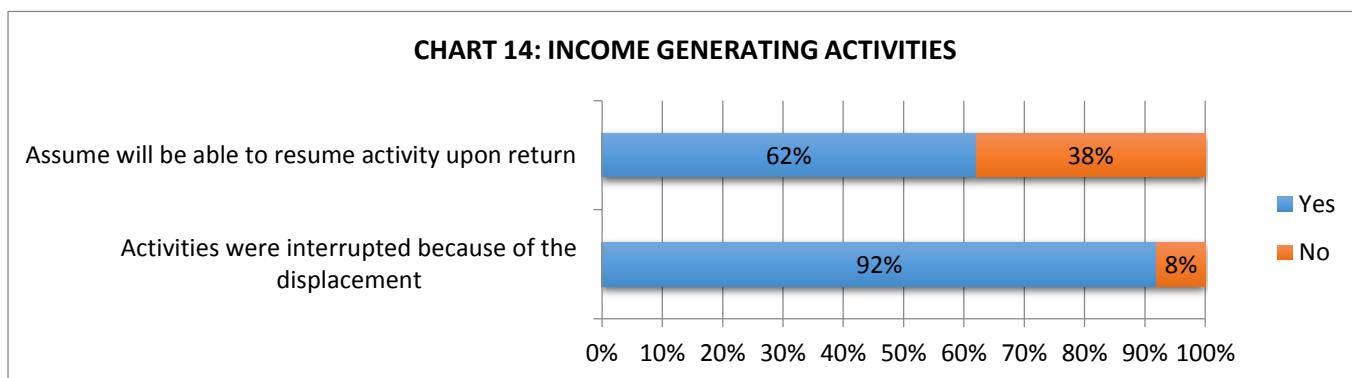

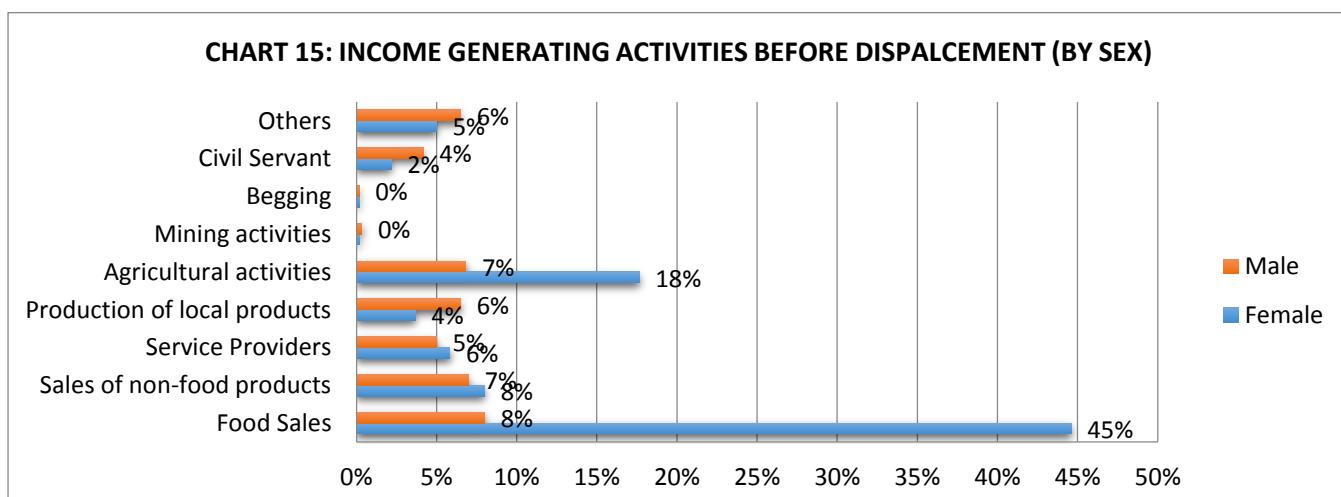

Chart 15 shows the main income generating activities of respondents before displacement were food sales for both men (8%) and women (45%). This is followed by agricultural activities, 18% for women and 7% for men.

CONCLUSION

Since last month, the number of displacement sites remained the same, between 43 and 44 sites, but the number of displaced persons decreased from 135,943 to 117,379. This may represent increased quality of assessments with current numbers being more reliable than those of January and February. Or this may indicate that the sites are less populated and a process of return, though slow and not systematic, is being observed especially in the last months.

Critical areas like PK5 are benefitting from a more visible presence of the military forces while in other districts basic services like schools and health centres re-started and are attracting the displaced population back to the *quartiers*.

Increasing security in the areas of return remains the main critical point to enable a sustainable return but other interventions seem now equally if not more important, especially housing and employment for those who lost their belongings following the events of December 2013.

The severe economic crisis remains in the background of this complex picture. Exchanging belongings, work tools and other personal properties (durable goods) to buy food (non-durable goods) is a clear sign that people are not coping with the present challenges and have no choice but to sell their belongings to endure another day or week. Reducing food portions and number of meals are other drastic measures to cope with this critical situation.

As expected, there was an apparent correlation between level of income and length of permanence in displacement sites. After more than six months the most vulnerable population remains displaced while individuals and households whom had means and support already moved from the sites.

The majority (66%) of displaced households in Bangui report that they do not have the necessary financial means to return in the near future. While the situation will be monitored, viable solutions should be quickly identified and implemented to reduce the potential for the current spontaneous displacement, triggered by a situation of violence and insecurity, to turn into a permanent or continuous situation of displacement due to lack of financial means or livelihood options to return to life outside the sites. It is too early to observe conditions of long-term displacement but this is certainly a risk that will increase if durable return solutions are not found in the coming weeks.
