

## OVERVIEW

The annual rainy season in Nigeria generally starts in April, with the highest concentration of rainfall between June and September. Between August and September 2024, hefty rains affected many LGAs in Borno State, resulting in significant flooding that has devastated various communities. Furthermore, on 9 September 2024, Maiduguri was affected by a massive flood due to the collapse of Alau dam in the neighbouring Konduga LGA of Borno State. The collapse of the dam, exacerbated the flooding in Maiduguri in addition to the continuous heavy rainfall. This marks the first time the Alau Dam has overflowed since 2012. The floods have caused extensive damage to infrastructure, crops, and shelters, severely affecting livelihoods and displacing many households. Climate variability and human-induced factors have exacerbated the flood recently, leading to increased displacement across Nigeria.

Between 4 and 12 September 2024, the Displacement Tracking Matrix (DTM), in collaboration with the National Emergency Management Agency (NEMA), the Borno State Emergency Management Agency (BOSEMA), and the Nigerian Red Cross Society (NRCS), identified 138 locations in Borno State that were impacted by floods or received internally displaced persons (IDPs) due to the flooding. Through a network of key informants and field focal points, and in close coordination with other humanitarian partners and local authorities, DTM conducted assessments in these locations to provide insights to the humanitarian community on the affected population's primary needs, vulnerabilities, and mobility intentions.

In the 19 local government areas (LGAs) of Borno State that were assessed, DTM identified 320,791 individuals in 65,731 households affected by the floods. These individuals included IDPs displaced by the floods and residents impacted by the floods but remained in their communities. The affected population included 122,774 displaced individuals and 108 returnees.

## METHODOLOGY

Crises and emergencies require the humanitarian community to act urgently. As a subcomponent of DTM's mobility tracking, flash reports utilise direct observation and a broad network of key informants to monitor sudden displacement resulting from disasters or attacks and collect information on the number, profile, and immediate needs of affected populations. In the initial 24 - 48 hours after an incident, DTM Nigeria activates a rapid assessment to document the event, urgent needs of affected individuals, demographic information, and impact. DTM Nigeria issues an Early Warning Flash/Incident report within 72 hours if displacement occurs, notifying partners and stakeholders.

IOM Nigeria thanks the following partners for their continued support and collaboration in making this report available.

Humanitarian Aid and Civil Protection

# FLOOD SITUATION REPORT — BORNO STATE

## LGAs affected by floods

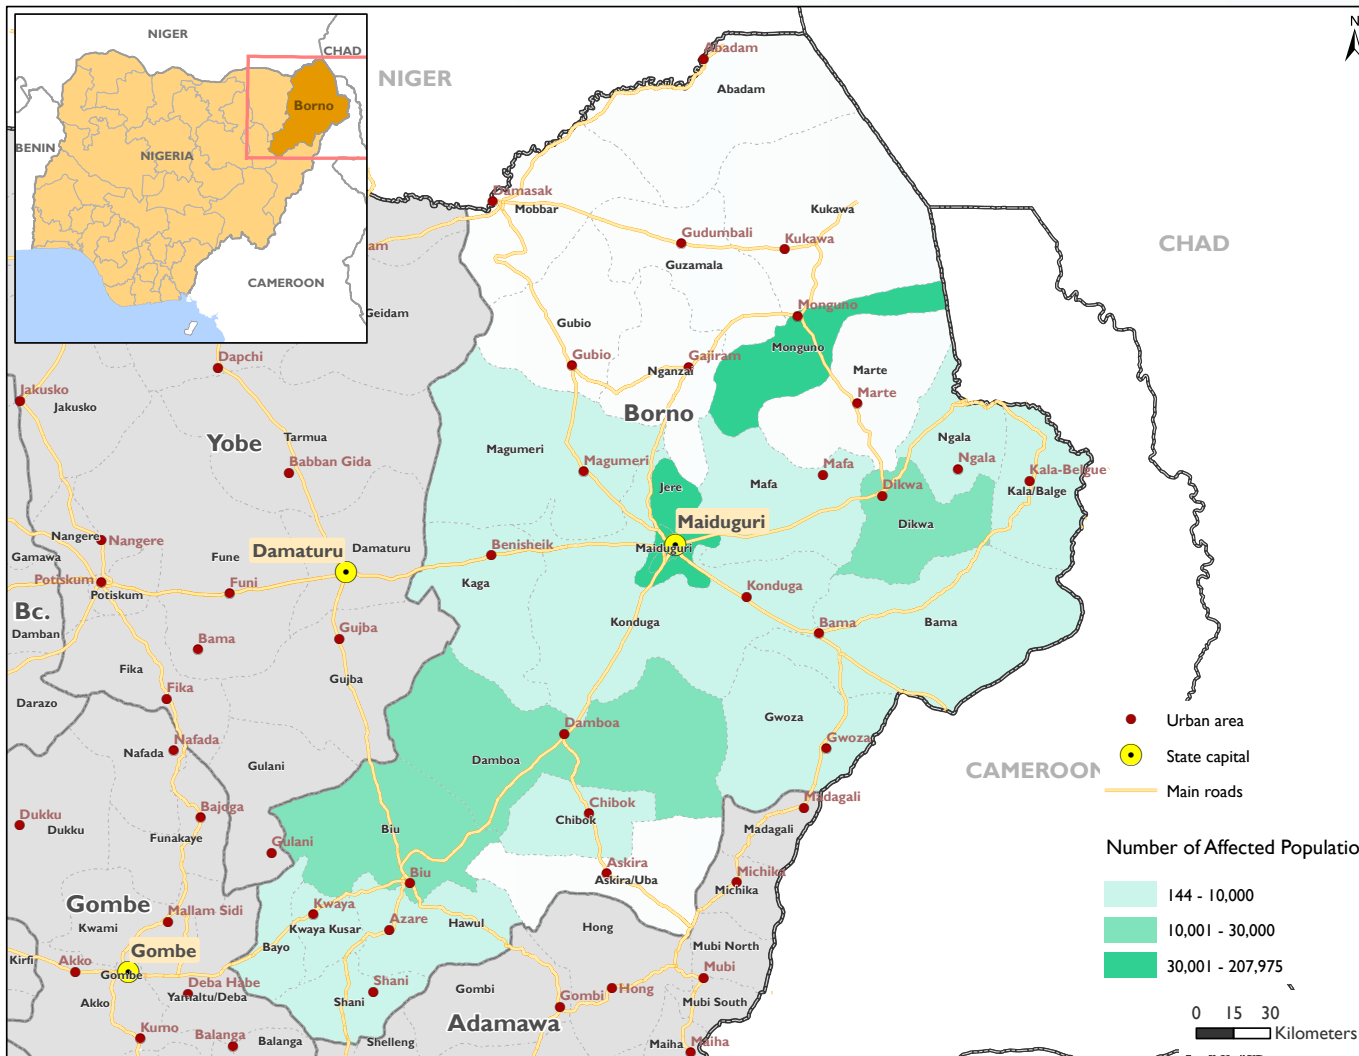

Fig. 2: Demographic breakdown

The demographic analysis of the population affected by the flood in Borno State highlights key groups that will require targeted assistance. Children between 1 and 17 years represent a significant portion of the population, necessitating attention to their educational, nutritional, and protection needs. As the largest group, adults (18-59 years) are expected to play a central role in recovery efforts and may need support to regain their livelihoods. Older people, though a smaller group, remain particularly vulnerable and require special attention to health and mobility needs. The overall population is almost evenly split between males and females, with a slight majority of females (55%). This balanced distribution suggests that response efforts should be designed to address the needs of both genders equally, with an awareness of gender-specific vulnerabilities and roles. Gender-sensitive approaches should be incorporated into all aspects of the response.

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error-free, nor do they imply a judgment on the legal status of any territory or any endorsement or acceptance of such boundaries by IOM.

Maiduguri Metropolitan Council (M.M.C.) recorded the highest number of affected individuals with 163,307 persons, accounting for 59 per cent of the affected population in Borno State. Maiduguri M.C. is followed by Monguno LGA, which reported 47,520 affected individuals or 13 per cent of the population. Jere LGA hosted 39,597 individuals, representing 11 per cent of the affected population. Other LGAs, such as Chibok (991 individuals), Bayo (738 individuals), Hawul (594 individuals), Shani (462 individuals), and Gwoza (144 individuals), account for less than one per cent of the overall affected population. In total, 65,731 households and 320,791 individuals were affected by the flood across the assessed LGAs in Borno State.

## MOST URGENT NEEDS

Food was reported among the top three most urgent needs in 93 per cent of locations assessed. Food security is a primary concern, likely due to the destruction of crops, disruption of markets, and the displacement of families from their sources of income and sustenance due to the flooding. Food was closely followed by shelter, reported in 91 per cent of the locations. This further highlights the impact of the flood, which caused widespread destruction of homes and the displacement of households. Non-food items (NFIs) were mentioned in 89 per cent of locations assessed: Non-food items, such as blankets, clothing, cooking utensils, and hygiene products, were urgently needed. Many households have lost their possessions or do not have sufficient resources to meet basic daily needs. Providing NFIs would help restore a sense of normalcy and improve living conditions in displacement settings. Although a smaller percentage (9%) of the locations assessed identified health as an immediate need, it remains significant, indicating that access to healthcare services and medical supplies was a concern. This could be due to injuries from the floods, the spread of waterborne diseases such as cholera, or the disruption of existing healthcare facilities.

Water, sanitation and hygiene services were critical for four per cent of the locations assessed. While this percentage may seem low, it still indicates a need for clean water access and improved sanitation facilities to prevent disease outbreaks, particularly in overcrowded shelters. The need for psychosocial support was identified by three per cent of the locations assessed, which may reflect the emotional and psychological toll of the disaster. The provision of mental health and psychosocial services remains essential to address trauma, stress, and anxiety caused by the loss of homes, livelihoods, and loved ones.

Security was noted in one per cent of the locations as an urgent need, suggesting that the immediate physical safety of the affected population was not a primary concern at this stage. However, ongoing monitoring and support for security services may be required to ensure stability, especially in crowded displacement areas.

The most pressing needs reported were related to basic survival, with food, shelter, and non-food items being the top priorities.

Fig. 3: Top most urgent needs (multiple responses)

## VULNERABILITY

Diverse vulnerabilities were identified among the displaced population due to the floods. Pregnant women (15,541 individuals), breastfeeding mothers (29,597 individuals), the elderly (14,837 individuals), and persons with chronic illnesses (447 individuals) require immediate and sustained access to healthcare services. These individuals face significant health risks in displacement settings, where access to healthcare services might be limited, and living conditions could exacerbate pre-existing conditions. Unaccompanied children (316 individuals) and orphaned minors (1,512 individuals) need protection services to ensure their safety and well-being.

Fig. 4: Vulnerable persons

## IMPACT AND GAPS

### Livelihood

The breakdown of the primary sources of livelihood for the affected population highlights dependency on various income-generating activities, such as crop/vegetable farming, which accounts for 41 per cent of locations assessed. Crop and vegetable farming are the dominant livelihood activities for most individuals in the assessed locations in Borno State. Other income sources include petty trade, mentioned in 29 per cent of the assessed locations. Firewood collection is recorded in 12 per cent of the locations, and eight per cent of the locations were dependent on humanitarian assistance.
