

Fig 1 Key highlights

OVERVIEW

The annual rainy season in Nigeria occurs from April to October, with the highest concentration of rainfall between June and September. Many states have been impacted by hefty rains from July to August, resulting in significant flooding that has devastated various communities. The floods have caused extensive damage to infrastructure, crops, and shelters, severely affecting livelihoods and displacing many households. Climate variability and human-induced factors have exacerbated the flood recently, leading to increased displacement across Nigeria.

Between 4 and 8 September 2024, the Displacement Tracking Matrix (DTM), in collaboration with the National Emergency Management Agency (NEMA), the Zamfara State Emergency Management Agency (ZSEMA), and the Nigerian Red Cross Society (NRCS) identified 51 locations in Zamfara State that were impacted by floods or received internally displaced persons (IDPs) due to the flooding. Through a network of 25 key informants and field focal points, and in close coordination with other humanitarian partners and local authorities, DTM conducted assessments in these locations to provide insights to the humanitarian community on the affected population's primary needs, vulnerabilities, and mobility intentions.

In the eleven (11) local government areas (LGAs) of Zamfara State that were assessed, DTM identified 70,819 individuals in 13,965 households affected by the floods. These individuals included IDPs displaced by the floods and residents impacted by the floods but remained in their communities. The affected population included 17,623 displaced individuals and 1,238 returnees. forty-nine per cent (49%) of the affected houses are habitable but need repair, twenty-eight per cent of the houses are partially damaged and sixteen per cent are completely destroyed. In 31 per cent (31%) of the locations assessed, crop farming was among the primary sources of income.

METHODOLOGY

Crises and emergencies require the humanitarian community to act urgently. As a subcomponent of DTM's mobility tracking, flash reports utilise direct observation and a broad network of key informants to monitor sudden displacement resulting from disasters or attacks and collect information on the number, profile, and immediate needs of affected populations. In the initial 24 - 48 hours after an incident, DTM Nigeria activates a rapid assessment to document the event, urgent needs of affected individuals, demographic information, and impact. DTM Nigeria issues an Early Warning Flash/Incident report, notifying partners and stakeholders within 72 hours if displacement occurs.

FLOOD SITUATION REPORT — ZAMFARA STATE

LGAs affected by floods

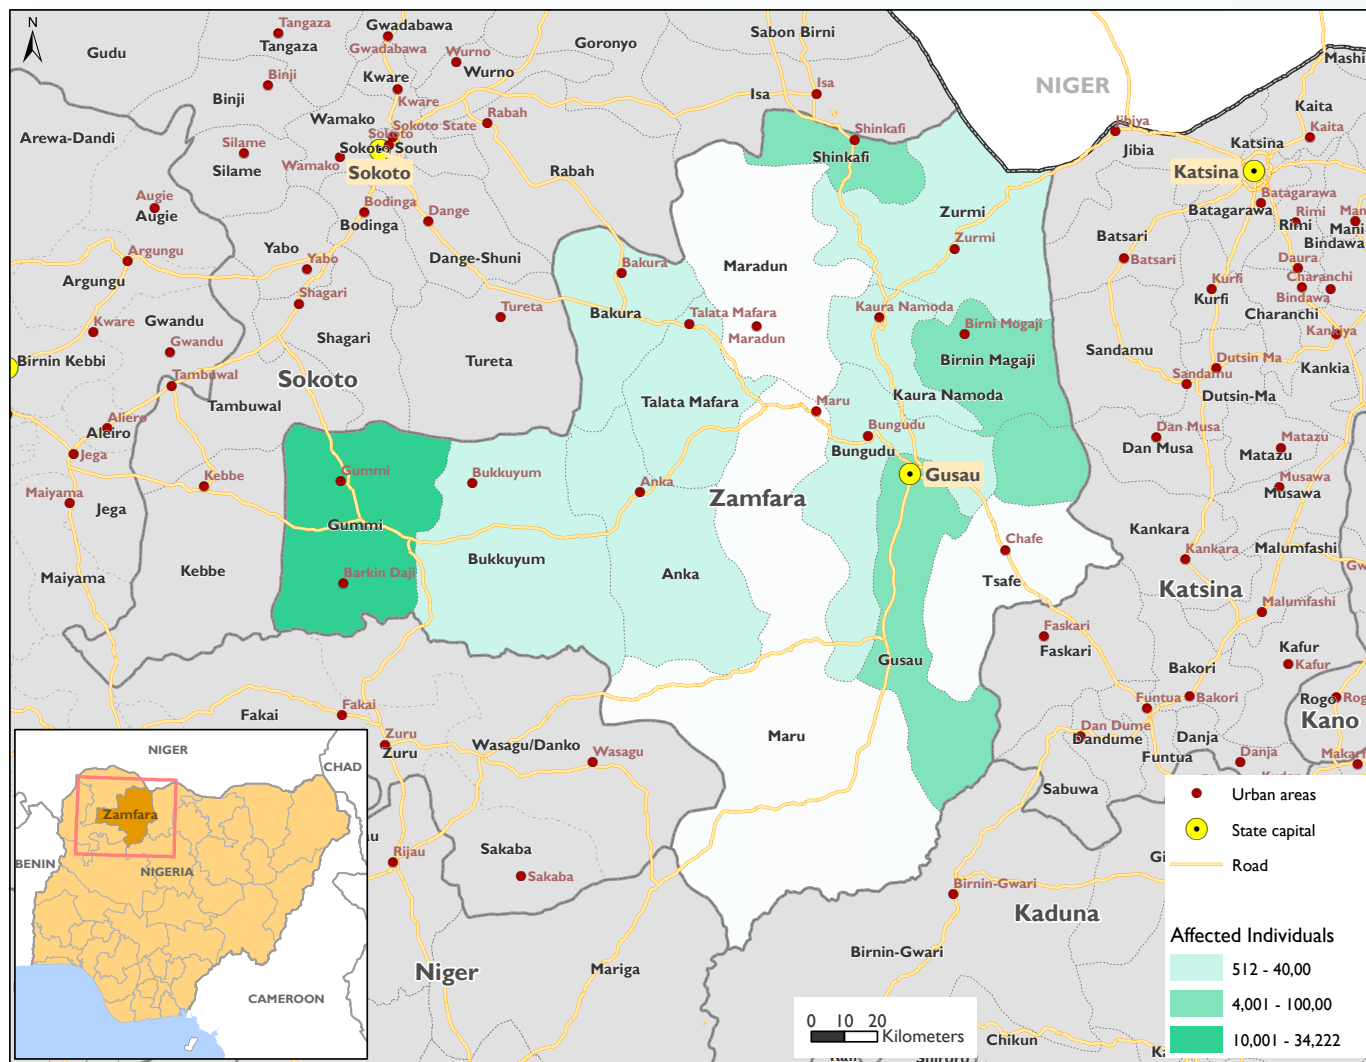

Fig 2 Demographic breakdown

The demographic analysis of the population affected by the flood in Zamfara State highlights key groups that will require targeted assistance. Children between 1 and 17 years represent a significant portion of the population, necessitating attention to their educational, nutritional, and protection needs. Adults (18-59 years) are expected to play a central role in recovery efforts and may need support to regain their livelihoods. Older people, though a smaller group, remain particularly vulnerable and require special attention to health and mobility needs. The overall population consists of a higher percentage of females (55%) compared to males (45%), which must be taken into account in all aspects of the response.

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error-free, nor do they imply a judgment on the legal status of any territory or any endorsement or acceptance of such boundaries by IOM.

Gummi LGA had the highest number of affected persons, with 34,222 individuals or 48 per cent of the affected population in the state. Gusau followed with 9,355 individuals or 13 per cent. Birnin Magaji recorded 7,447 individuals, representing 11 per cent, while Shinkafi had 5,362 individuals or eight per cent. Bakura had 3,882 individuals affected, accounting for five per cent, and Kaura Namoda followed with 3,073 individuals or four per cent. Anka also had 2,460 individuals or three per cent, while Zurmi had 2,060 or three per cent. Talata Mafara recorded 1,645 individuals, Bukkuyum 801, and Bungudu 512, all making up one per cent each.

KEY HIGHLIGHTS

Food was reported among the top three most urgent needs in 100 per cent of locations assessed. This may be due to disrupted food supply chains, loss of crops, and livelihood destruction due to the flooding. Food was followed by shelter in 96 per cent of locations assessed: this reflected damages to homes and displacement. Temporary shelter solutions, and long-term rehabilitation will be essential to support the affected population. Nearly 18 per cent of the population is experiencing health-related challenges, including a lack of access to medical services, the spread of waterborne diseases, or injuries sustained during the floods. There is a need for healthcare services and medical supplies in these locations.

One-third of the locations assessed need non-food items (NFIs), such as blankets, clothing, cooking utensils, and hygiene products. This suggests that many people have lost personal possessions or have insufficient resources to meet their basic needs.

The relatively low demand for education and psychosocial support might suggest that education for children and mental health needs are underreported or not yet prioritised by affected communities. However, this remains an essential area of focus, as the education for children and the psychological impact of displacement and loss are significant. The low need for security services suggests that, for now, the affected populations feel relatively safe regarding physical security. However, ongoing monitoring will be necessary to ensure that security remains stable as humanitarian efforts progress.

In conclusion, the most pressing needs were food, non-food items, water/sanitation, shelter, and health, which required immediate attention. Efforts to address these areas will be critical in stabilising the affected communities and helping them recover from the impact of the floods.

Fig 3 Top most urgent needs (multiple responses)

VULNERABILITY

Diverse groups of vulnerabilities were identified among the displaced population. Pregnant women (2,274 individuals), breastfeeding mothers (4,476 individuals), the elderly (678 individuals), and persons with chronic illnesses (319 individuals) require immediate and sustained access to healthcare services. These individuals face significant health risks in displacement settings, where access to healthcare services may be limited, and living conditions exacerbate pre-existing conditions. Unaccompanied children (95 individuals) and orphaned minors (687 individuals) need protection services to ensure their safety and well-being.

Fig 4 Vulnerable persons

IMPACT AND GAPS

Livelihood

The breakdown of income sources for the affected population, reveals a dependence on petty trades, accounting for 41 per cent of locations assessed, followed by agriculture, particularly crop and vegetable farming, accounting for 31 per cent. Other income sources include casual labourers, who are mentioned in 14 per cent of the assessed locations. Small business activities accounted for eight per cent, while collecting firewood, livestock farming and artisan were minor activities mentioned in two per cent of each of the assessed locations.
