

Fig. 1. Key highlights

OVERVIEW

The rainy season in Nigeria typically occurs annually, with the highest concentration of rainfall between June and September. Many states have been impacted by hefty rains from July to October, resulting in significant flooding that has devastated various communities. The floods have caused extensive damage to infrastructure, crops, and shelters, severely affecting livelihoods and displacing households. Climate variability and human-induced factors have exacerbated recently, leading to increased displacement across Nigeria.

Between 28 October and 03 November 2024, the Displacement Tracking Matrix (DTM), in collaboration with the National Emergency Management Agency (NEMA), the Edo State Emergency Management Agency (SEMA) and the Nigerian Red Cross Society (NRCS), identified 16 locations in Edo State that were impacted by floods or received internally displaced persons (IDPs) due to the flooding. Through a network of key informants and field focal points, and in close coordination with other humanitarian partners and local authorities, the joint assessment team conducted assessments in these locations to provide insights to the government and humanitarian partners on the affected population's primary needs, vulnerabilities, and mobility intentions.

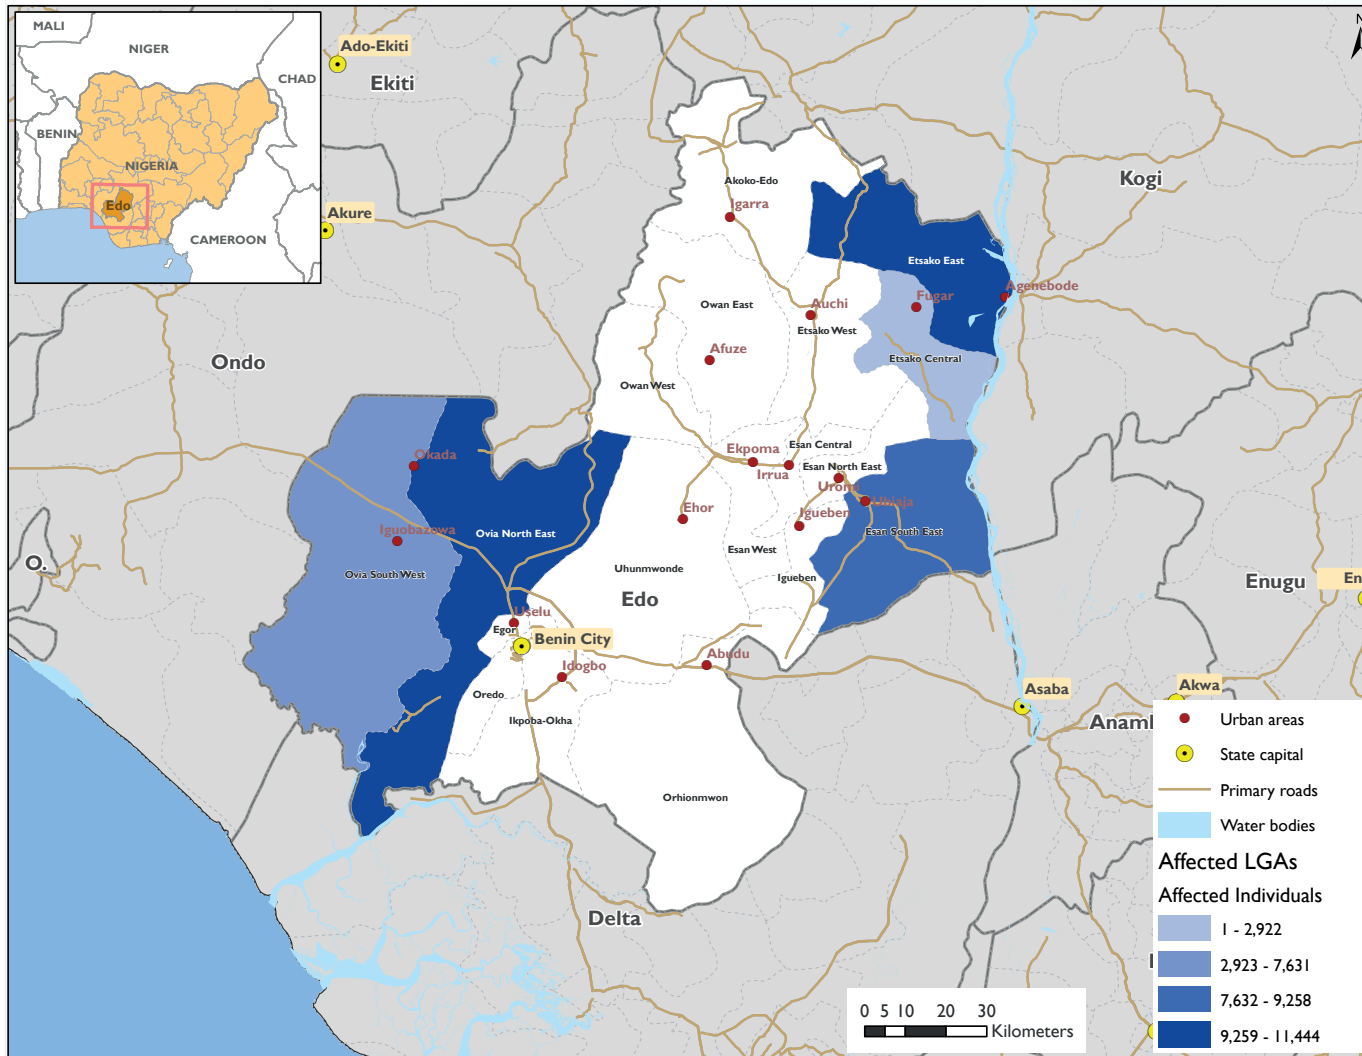

In the five local government areas (LGAs) of Edo State that were assessed, the joint assessment team identified 42,284 individuals in 7,656 households affected by the floods. These individuals included IDPs displaced by the floods and residents impacted by the floods but remained in their communities. Twenty-four per cent (24%) of the affected houses were completely destroyed, 22 per cent were partially damaged and 17 per cent were habitable but need repairs. In 81 per cent of the locations assessed, crop farming was among the primary sources of income.

METHODOLOGY

The Joint Post-Flood Assessment employs direct observation, key informant interviews, and focus group discussions to gather data on the impact, living conditions and needs of flood-affected populations. Using a participatory approach, the assessment integrates field visits and remote interviews in inaccessible areas, leveraging collaboration with government and humanitarian partners for accurate data collection. Data is triangulated across multiple sources to ensure reliability, while ethical principles and cultural sensitivities guide the process. Findings provide actionable insights for government and humanitarian partners to address urgent needs and inform emergency response strategies.

JOINT POST-FLOOD SITUATION REPORT — EDO STATE

LGAs affected by floods

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error-free, nor do they imply a judgment on the legal status of any territory or any endorsement or acceptance of such boundaries by IOM.

Etsako east recorded the highest number of individuals affected by flooding, with 11,444 people, followed closely by Ovia north east with 11,029 individuals, making up the majority of the affected population. Other areas with smaller affected populations included Esan south east (9,258), Ovia south west (7,631) and Etsako central (2,922). The flooding affected a combined total of 7,656 households and 42,284 individuals across the five listed LGAs in the state.

Fig. 2. Demographic breakdown

The demographic analysis of the population affected by the flood in Edo State highlights key groups that will require targeted assistance. Children between 1 and 17 years represent a significant portion of the population, necessitating attention to their educational, nutritional, and protection needs. As the largest group, adults (18-59 years old) are expected to play a central role in recovery efforts and may need support to regain their livelihoods. Older people, though a smaller group, remain particularly vulnerable and require special attention to health and mobility needs. The overall population consists of 46 per cent males and 56 per cent females, underscoring the need for gender-sensitive approaches to be incorporated into all aspects of the response.

PRIORITY NEEDS

Food was identified as one of the top three most urgent needs in all the locations assessed, likely due to disrupted food supply chains, crop losses, and destruction of livelihoods caused by the flooding. Following food, 75 per cent of the locations highlighted a need for shelter, reflecting widespread damage to homes and displacement. Both temporary shelter solutions and long-term housing rehabilitation would be critical to support the affected population. Additionally, 56 per cent of the locations reported a need for cash or vouchers, emphasizing the flexibility and agency this assistance provides. Cash-based interventions enable affected households to prioritize their most urgent needs, whether for food, household items, or healthcare.

Fifty per cent of the locations assessed identified a need for health services. The demand for health services underscores the critical need to strengthen healthcare systems in the affected areas. Prioritizing access to medical care, including treatment for flood-related injuries, management of chronic illnesses, and prevention of disease outbreaks, is essential to supporting the well-being of the population.

Thirteen per cent required non-food items such as blankets, clothing, cooking utensils, and hygiene products. This indicates that the floods resulted in significant material losses, leaving many without basic necessities for daily living.

In conclusion, it was reported that the most pressing needs were food, shelter, cash/vouchers, health as well as NFI, all of which require immediate attention. Efforts to address these areas will be critical in stabilising the affected communities and helping them recover from the impacts of the floods.

Fig. 3. Top most urgent needs (multiple responses)

VULNERABILITY

Diverse vulnerabilities are identified among the displaced population. The elderly (2,353 individuals), breastfeeding mothers (1,777 individuals), pregnant women (313 individuals), and people with chronic illnesses (102 individuals) require immediate and sustained access to healthcare services. Additionally, 55 persons with disabilities face increased barriers to accessing services and safety, while unaccompanied children (7 individuals) and orphaned minors (3 individuals) urgently need protection services to ensure their safety and well-being.

These vulnerable groups face significant health risks in displacement settings, where limited access to healthcare services and poor living conditions exacerbate pre-existing conditions.

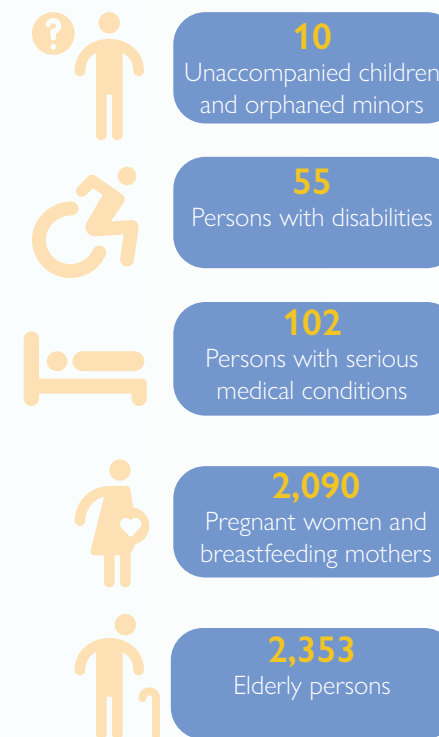

Fig. 4. Vulnerable persons

IMPACT AND GAPS

Livelihood

The breakdown of income sources for the affected population, highlighted a significant reliance on crop and vegetable farming, which represented 81 per cent of the locations assessed. Agriculture, particularly crop and vegetable farming, was the dominant livelihood activity for most individuals in the assessed locations in Edo State. Fishing, mentioned in 19 per cent of the assessed locations, suggested that a small portion of the population is engaged in this work.
