

**INTRODUCTION:** IOM works with national and regional authorities, as well as local partners to better understand migration movements across **West and Central Africa**. This report presents data collected in October 2019 at key transit points in **Faya, Zouarké, Rig-Rig and Sarh in Northern, Western and Southern Chad**. These Flow Monitoring Points (FMPs) were set up to monitor the movements of travellers in transit through the country.

In October 2019, an average of 707 individuals were observed at Chad FMPs, each day. This represents a 5 per cent decrease compared to September 2019, during which an average of 745 individuals were observed every day. **This decrease can be explained primarily by the decrease in flows observed at the Faya FMP, due in part to the presence of tax collectors at the location where the FMP is situated, which contributed to a significant number of transporters trying to access or leave Faya, bypass the FMP. The presumption of instability in Miski and the state of emergency in the province of Tibesti also contributed to this decrease.** The main types of movements of travellers observed at FMPs were short-term local movements, accounting for 46 per cent of flows. In October 2019, 90 per cent of travellers were adults (68% were men and 22% were women), while 10 per cent were children (5% of boys and 5% of girls). Chadian nationals made up the overwhelming majority of travellers (97%), followed by Central African (2%) and Nigerian (<1%) nationals. Sarh, Faya, Sido and Abéché were the primary locations of origin of travellers with respectively 27, 18, 10 and 10 per cent of travellers. Faya (19%), Sido (16%) and Sarh (15%) were the main destinations of travellers.

**METHODOLOGY :** Flow Monitoring (FM) is a data collection exercise which aims to identify areas with high internal, cross-border and inter-regional mobility. These areas are first identified at the national level, in collaboration with national authorities. DTM teams then choose, following consultations with key national and local stakeholders involved in migration management, key transit points where Flow Monitoring Points (FMPs) are set up. FMPs are selected based on the location and distinctive characteristics of flows in each area. Enumerators collect data at FMPs through a combination of direct observation and interviews with Key Informants (KI), such as bus station staff, police or customs officials, bus drivers, or the migrants themselves. Data is collected on the profiles and travel experiences of migrants, disaggregated by sex and nationality. Data is collected on a daily basis, at peak hours.

**LIMITATIONS :** Data collected during Flow Monitoring exercises should be understood as estimates only. Because of their restricted geographical (key transit points) and temporal (daily, during a specific time window) coverage, they reflect only part of the flows transiting through areas of high mobility. In Chad, FMPs collect data on flows leaving and reaching the towns in which they are installed, and do not offer a complete picture of mobility flows in the country. Finally, information on vulnerabilities is gathered by enumerators through direct observation and should be understood as purely indicative.

### DESTINATION OF TRAVELLERS, BY TYPE OF MOVEMENT

### NATIONALITIES OBSERVED

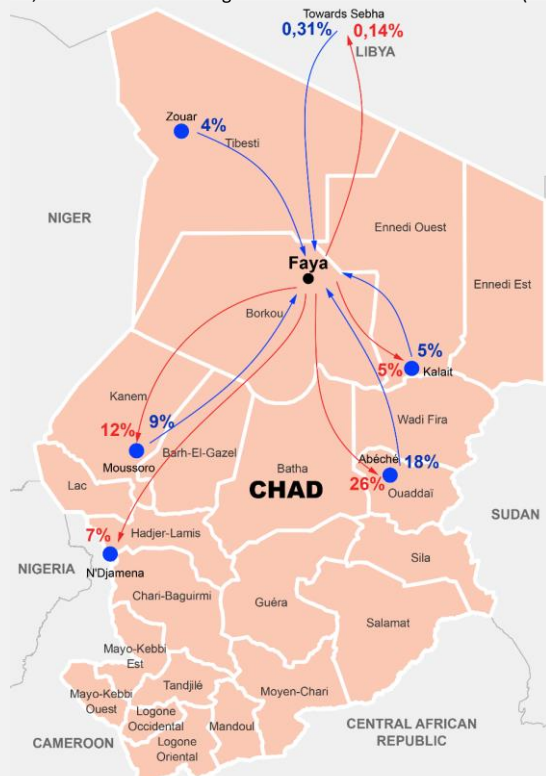

A Flow Monitoring Point (FMP) was set up in Faya in March 2018 allowing IOM to monitor the flow of travellers in transit. This page presents a summary of the data collected at the Faya FMP in October 2019.

Over the course of the month, the average daily number of individuals observed was 223, compared to 291 in September 2019. The difference between the two months could be explained by the presence of tax collectors near the Faya FMP, which contributed to a significant number of transporters trying to access or leave Faya, bypass the FMP. Additionally, the presumption instability in Miski and the state of emergency in the province of Tibesti both contributed to the observed decline: the flows coming from Tibesti decreased from 18 to 4 per cent compared to the previous month.

Short-term local movements (49%) and economic migration (48%) were the main types of movements observed. Faya (57%), Abéché (18%), Moussoro (9%) and Kalait (5%) were the main locations of origin of flows observed during this month. Faya also constituted the main destination for the flows with 44 per cent of travellers heading there, followed by the city of Abéché with 26 per cent of travellers heading there. Observations during this month showed that 90 per cent of travellers were adults; of which, 72 per cent were men, 18 per cent were women, and 10 per cent were minors (5% of boys and 5% of girls). The travellers observed during this month at the Faya FMP were mainly Chadian nationals (97%). However, Central African and Nigerian nationals were also observed (3%).

### Observed movements to and from Faya in October 2019

-  Outgoing flows from Faya
-  Incoming flows to Faya
-  Faya FMP
-  Origin/Destination of flows in Zouarké

### DESTINATION OF TRAVELLERS, BY TYPE OF MOVEMENT

### NATIONALITIES OBSERVED

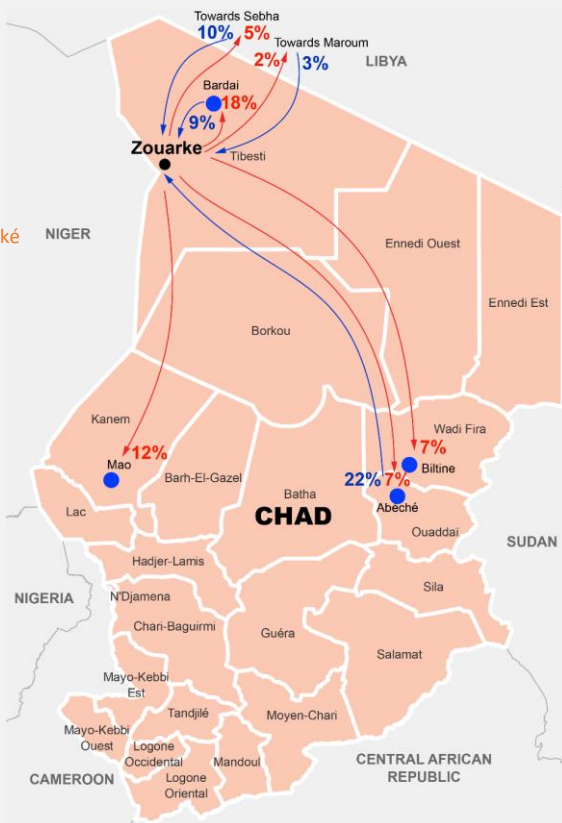

A Flow Monitoring Point was set up in **Zouarké** in **April 2017** to monitor flows of travellers in transit. This FMP was inactive from October 2018 to June 2019 because of the security situation in the area, but was reactivated in **July 2019**. This page presents a summary of the data collected at the Zouarké FMP in October 2019.

Over the course of the month, an average of 129 individuals were observed every day compared to the 108 individuals observed in September. This increase of 19 per cent can be explained by a significant movement of livestock breeders from the East to the North to sell their livestock. **Economic migration** (46%) and **short-term local movements** (40%) were the main types of movements observed during this period. Zouarké and Abéché in Chad, along with Sebha in Libya, were the main locations of origin of flows with 31, 22 and 10 per cent of travellers, respectively, coming from these cities. Many sheep vendors came from Abéché trying to get to Zouarké. The main destinations of travellers were Zouarké (25%), Bardai (18%) and Mao (12%). Chadian nationals (99%) accounted for almost all nationalities observed at the Zouarké FMP in October 2019. A very small number of Sudanese travellers (1%) was also observed.

### Observed movements to and from Zouarké in October 2019

- Outgoing flows from Zouarké
- Incoming flows to Zouarké
- Zouarké FMP
- Origin/Destination of flows in Zouarké

A Flow Monitoring Point was set up in April 2019 in Rig-Rig to monitor flows of travellers in transit. This page presents a summary of the data collected at the Rig-Rig FMP in October 2019.

Over the course of the month, an average 35 individuals were observed every day, compared to 33 in September 2019, constituting a 6 per cent increase. In absolute values, however, there were only two more people observed at the FMP when compared to September. This slight increase can be explained by the closure of the border between Niger and Nigeria, resulting in a decrease in the number of traders passing through Rig-Rig to travel to Niger and further on to Nigeria for their commercial activities. **Short-term local movements** (47% of observed movements) were the main types of movements observed at the Rig-Rig FMP during this period. N'Guigmi in Niger (75%) and N'Djamena in Chad (21%) were the main cities of flows of origin observed during this month. These two cities were also the main destinations of travellers, with 71 per cent of travellers going to N'Djamena and 27 per cent of travellers going to N'Guigmi. The travellers observed during this month were mostly Chadian nationals (93%), followed by Nigerian (5%) and Togolese nationals (1%), as well as some Burkinabe and Nigerian nationals.

### Observed movements to and from Rig-Rig in October 2019

-  Outgoing flows from Rig-Rig
-  Incoming flows to Rig-Rig
-  Rig-Rig FMP
-  Origin/Destination of flows in Rig-Rig

### TRAVELLERS' PROFILE

A Flow Monitoring Point was set up in **May 2019** in **Sarh** to monitor flows of travellers in transit. This page presents a summary of the data collected at the Sarh FMP in October 2019.

Over the reporting period, an average of 324 individuals were observed every day, compared to 325 in September 2019. This represents a 0.3 per cent decrease from September, which is insignificant. When putting this 0.3 per cent in the context of the observed upward trend of 7 per cent between August and September, we can deduce that the observed trends in September are continuing into October where travellers' movement continues to be motivated by the harvest and purchase of agricultural products. **Short-term local movements** (47%), economic migration of more than six months (21%) and seasonal migration (15%) were the main types of movements observed at the Sarh FMP during this period. Sarh and Sido were the main locations of origin of flows observed during this month with 59 and 23 per cent of travellers, respectively, coming from these two cities. Likewise, Sido (41%) and Sarh (36%) were also the main destinations of travellers. Observations made during this month showed that 86 per cent of travellers were adults (53% were men and 33% were women), while 14 per cent were minors (6% of boys and 8% of girls). The travellers observed during this month were mainly Chadian nationals (96%), followed by Central African nationals (4%).
