

**INTRODUCTION:** IOM works with national and local authorities and local partners to identify and understand migration movements in **West and Central Africa**. Flow monitoring is an activity that quantifies and qualifies flows, migrant profiles, trends and migration routes at a given point of entry, transit or exit. The data collected provides an overview of migration in the region. **Since February 2016, IOM Niger has been monitoring migration flows at seven points across Niger.** Given the immensity of the region of Agadez, a new FMP (**Madama**) on the **Libyan border** was activated in **January 2019** to capture the inflows due to the proliferation of bypass roads. This new FMP complements the Séguédine FMP which only captures outgoing flows. The data collected provides an overview of migratory movements in the region.

### NIGER POPULATION FLOW MONITORING POINTS

Three cross-border FMPs (**Dan Issa, Dan Barto and Magaria**) were established in August and September 2018 on the border between Niger and Nigeria, which is over 1,000 kilometers long. The aim was to better understand migration routes along the southern part of Niger, and complement the existing FMPs in Arlit and Séguédine. An additional FMP was setup in **Tahoua**, in central Niger, to better understand internal movements.

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

**METHODOLOGY:** Flow monitoring is an investigative tool that aims to highlight further understanding of internal, cross-border and intraregional migration. Areas of high mobility are identified across the country. DTM teams then conducts assessments at the local level to identify strategic transit points. Enumerators collect data using key informants at the Flow Monitoring Points; they may be staff at bus stations, police or customs officials, bus or truck drivers, or migrants themselves. A basic questionnaire mixed with direct observations makes it possible to collect data disaggregated by gender and nationality. In Niger, the Flow Monitoring Points were chosen after consultation with national and local stakeholders involved in migration management, and according to the locations and characteristics of the flows transiting through the Sahara Desert. The data collection is done at times when the flows are the most frequent.

**LIMITATIONS:** The data used in this analysis, including the maps, is an estimate and represents only a part of the existing flows on the migration routes passing through the country. The spatial and temporal coverage of these surveys is partial, although the collection is done daily and during periods when flows are significant. Finally, no information is collected on existing flows outside the time periods covered. Vulnerability data is based on direct observations by the enumerators and should be understood only as an estimate.

### DEMOGRAPHICS

## APRIL 2020 SUMMARY

**4,562** Individuals entering Niger

**3,779** Individuals leaving Niger

**22,322** Individuals observed moving internally

**30,663** Number of individuals observed at the FMP

*“ All data included in this report is based on estimates. IOM makes no guarantees as to the timeliness, suitability, accuracy, reliability, quality or completeness of the data contained in this report.”*

## PRIMARY MEANS OF TRANSPORT IN APRIL 2020

7 Active FMPs in the Niger

10 Information focal points

## FLOWS OBSERVED IN APRIL 2020

## FLOWS OBSERVED IN APRIL 2020

### COMPARISON OF TRENDS (2018, 2019 and 2020)

The total incoming and outgoing flows (**8,341**) for **April 2020** were the **lowest recorded since June 2018** when the total incoming and outgoing flows were recorded at **4,317**. Comparing the total monthly flows (internal included), the month of **April recorded 30,663**, the lowest total recorded since the seven FMPs were active in Niger (**August 2018**).

The data in the graph below presents the total number of migrants identified at the seven Flow Monitoring Points (FMP) active in Niger, noting that only the FMPs of **Arilit** and **Séguédine** have been active **since February 2016**. Likewise, in August 2018 three new FMPs (Tahoua, Magaria and Dan Barto) were activated as well as another FMP (Dan Issa) in September 2018. Following the development of bypass routes, a seventh FMP (Madama) was activated in January 2019 to capture only the outgoing flows and complement Séguédine (which only captures incoming flows).

The analysis of data collected at **the seven FMPs** shows a 141 per cent increase in total flows in 2019 compared to the total flow in 2018. Comparing the period of July to December of the year 2018 to the same period in 2019 there is a general pattern of more migrants arriving and leaving Niger this year compared to the 2018. Specifically, an increase of 18 per cent was observed in the incoming flows against an increase of 21 per cent of outgoing flows. In addition, the highest peak in incoming flows was observed in January 2019 while for the outgoing flows it occurred during May 2019 with 24,808 and 22,493 individuals observed at the seven FMPs, respectively. These increases may be related to the fact that the enumerators received training and technical support as well as subsequent follow-up training.

The DTM Niger began collecting data on **internal movements in January 2018**. Comparing the data collected during the period of July to December 2018 to the same period in 2019, we clearly see that flows have increased by more than 140%. The largest peak of internal movements was observed in September 2019 with 30,152 individuals, compared to September 2018 with 6,134 individuals. This represents an increase of nearly 400 per cent.

### TYPES OF FLOWS OBSERVED

Year	Incoming	Internal	Outgoing	Total
2016	111,230	-	333,891	445,121
2017	98,306	-	69,430	167,736
2018	88,601	71,223	106,766	266,590
2019	173,737	267,228	202,409	643,374
2020	37,429	125,942	44,826	208,197

### NUMBER OF MIGRANTS OBSERVED AT THE FMP : FEBRUARY 2016 - MARCH 2020

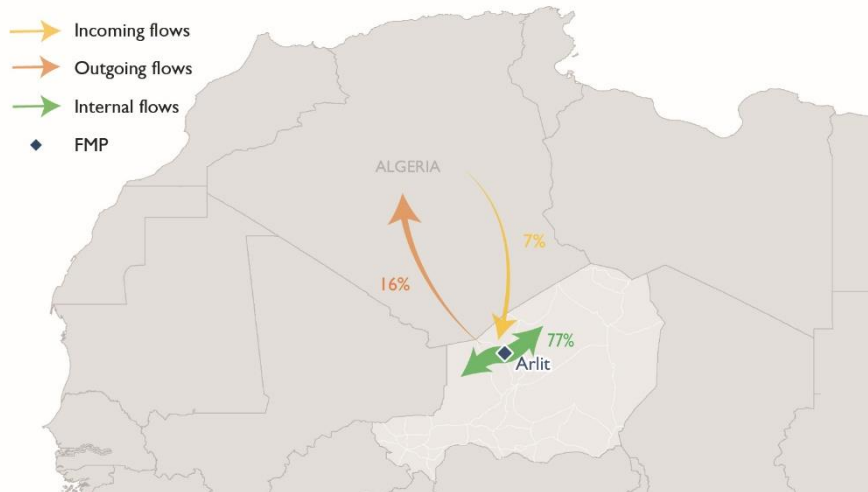

The **Arlit** Flow Monitoring Point captures both cross-border flows to and from Algeria, as well as internal movements in Niger. The Arlit FMP has been active since **February 2016**.

During the reporting month of April, more outgoing flows (2,681) than incoming flows (1,330) were observed. The main departure cities included Arlit, Agadez and Tchibarakaten (Niger); Tamanrasset and Inguezzam (Algeria), while the main destination cities included Arlit and Tchibarakaten. In fact, most migrants transiting through Assamaka were intending to travel to cities within Algeria including Tamanrasset, Inguezzam and Oran. Additionally, FMP figures do not include migrants who were subject to repression or were repatriated from Algeria as these are collected separately.

Compared to the previous month, the daily average decreased by 47 per cent with a daily average of 198 individuals crossing the FMP each day. This decrease can be explained by the movement restrictions observed in the last week of the month of March. The observed movements can be attributed to the resumption of gold mining activities in the northern part which also serves as a hub to connect Niger to North Africa (Algeria and Libya) for certain migrants. For these such migrants, this route is related to escaping the restriction of the law 036/2015 which criminalizes the illegal transport of migrants in this area of the country.

The main reasons for travel mentioned by the travelers were **seasonal migration (36%)** followed by **economic migration (34%)**, **short-term local movements (29%)** and **forced movements (1%)**.

The main nationalities observed crossing the Arlit FMP this month included Nigerien nationals (80%), Chadian and Nigerian nationals (5% each), Malian (3%) nationals. Other nationalities observed included Guinean, Sudanese, Cameroonian and Senegalese nationals, representing 7 per cent of observed individuals. It is important to note that the FMP breakdown of nationalities does not include migrants subject to repression and/or repatriated from Algeria via the official convoys.

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

NATIONALITIES OBSERVED

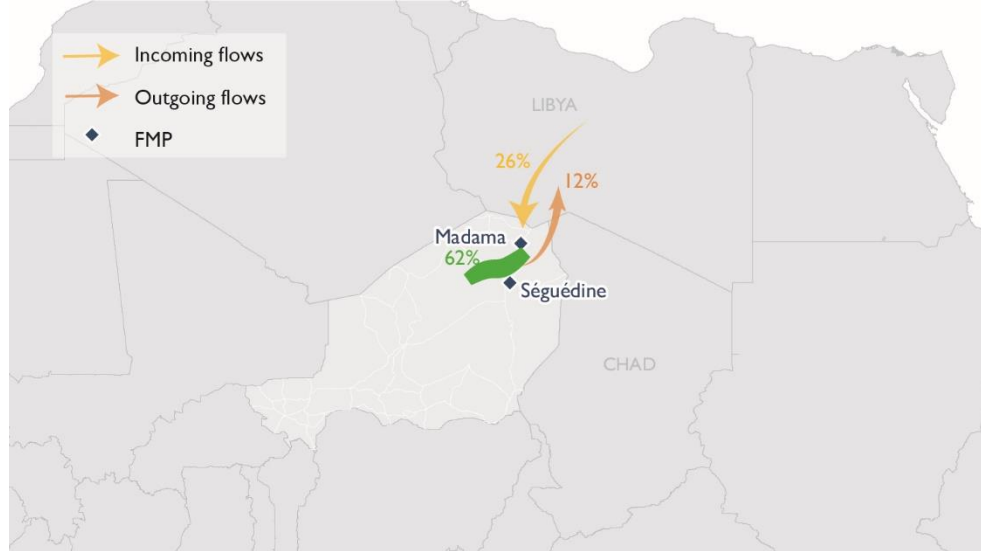

The **Séguédine and Madama** Flow Monitoring Point captures **cross-border flows** to and from neighbouring countries, mainly Libya. The Séguédine FMP has been active since February 2016. Given the vastness of the Agadez region which spans 703,000 km<sup>2</sup> (greater than the size of France and 21 times the size of Belgium), a **new FMP (Madama)** located near the Libyan border was activated in January 2019 to better capture cross-border movements due to the proliferation of bypass roads to avoid border control posts. This new FMP complements the FMP in **Séguédine which only captures outgoing flows**. As such, **Madama** only captures incoming flows.

During this month, more incoming flows (637 individuals representing 26% of flows observed) than outgoing flows (290 individuals or 12% of all flows) were observed. A daily average of 81 individuals were observed crossing through the Séguédine/Madama FMP this month. The daily average of individuals passing through this FMP has decreased by 59 per cent compared to the previous month when 195 individuals were crossing the border each day. This drop in flows is due to the current situation of the Covid-19 which slows down the movements of travelers.

The main reasons of movements observed were **economic migration (34%)** followed by **seasonal migration and short-term local movements (33% each)**. The search for employment in the gold sites in Murzuq as well as a return to calm in Libya consist of the main factors, among others, for the migration towards this country.

The main nationalities observed in April were mostly composed of Nigerien nationals (87%), followed by Nigerian nationals (7%) and nationals from Ghana (2%). Other nationalities observed at this FMP (4%) included Chadian, Lybian, Gambian nationals, among others.

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

The **Magaria** Flow Monitoring Point was established to observe cross-border flows between Niger and Nigeria, as well as internal flows. Magaria is a town on the border between Niger and Nigeria, through which high volumes of transit flows take place, originating from Nigeria which is one of the main points of origin for migrants travelling towards the Mediterranean sea. The Magaria FMP has been active since August 2018. Magaria is used mostly by Nigerien and Nigerian traders who have traditionally maintained an economic exchange. Most essential products towards Diffa and Zinder regions pass through this FMP. All cross-border flows observed were heading towards Niger or Nigeria and primarily coming from the departure cities of Magaria, Zinder, Dachi, Agadez, Tinkim, Bandé, Dungass, Tanout, Gada and Dogo (Niger) ; Babura, Garki, Kano, Baban Mutum and Daura (Nigeria).

A daily average of 129 individuals passing through the Magaria FMP was observed during this month, which represents a decrease of 9 per cent compared to the previous month, with more incoming flows (1,511 individuals or 39%) than outgoing flows (1,197 individuals or 31%), while almost a third of all flows observed were internal (1,566 individuals or 30%). The closure of the Nigeria - Niger and Nigeria - Benin border has been extended.

The reasons for migrating for most travellers were **short-term local movements (61%) while 34 per cent of individuals travelling reported economic migration.** Three per cent were seasonal migrants while 2 per cent were forced movements.

The main nationalities observed passing through this FMP in April 2020 were Nigerien (78%) and Nigerian (20%) nationals, followed by Chadian and Beninese nationals (1% each).

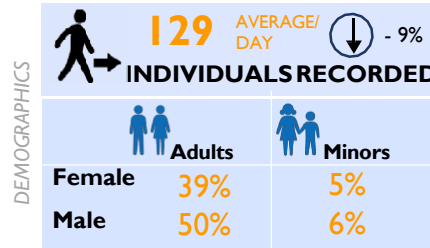

Most migrants transiting through the Magaria FMP travelled using private vehicles (91%) and trucks (12%).

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

The **Dan Barto** Flow Monitoring Point captures cross-border flows between Niger and Nigeria. Dan Barto is a town near the Nigerian border, through which high volumes of flows originating from Nigeria transit, often travelling towards the Mediterranean sea via Agadez and Libya. The Dan Barto FMP has been active since August 2018. Dan Barto is mostly used by Nigerien and Nigerian traders who maintain a close economic relationship. Nigerien nationals travel to Nigeria to purchase goods while Nigerian nationals travel to Niger to purchase animals and food (millet, beans, etc.).

A daily average of 477 individuals passing through the Dan Barto FMP was observed during this month which represents a decrease of 4 per cent compared to the previous month which recorded 497 individuals crossing the FMP each day. The flows observed this month were mainly internal movement, largely due to the closure of the Niger - Nigeria border, which is strictly enforced by the Nigerian border police. However some travelers take other crossing routes using other means which will allow them to cross the border.

The reasons cited for migrating were mostly **seasonal migrations (49%)** followed by **short-term local movements (33%), forced movements (17%)** and **economic migration (1%)**.

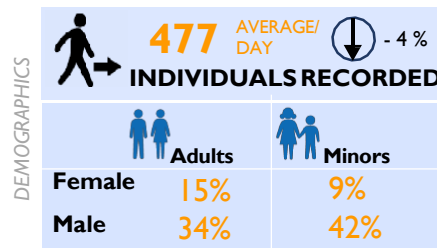

The nationalities observed crossing the FMP of Dan Barto included Nigerien (88%), Nigerian (11%) and Beninese (1%) nationals.

About half of the individuals were observed travelling by private vehicles (50%), followed by bus (44%), trucks (3%) and motorcycles (2%).

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

The **Dan Issa** Flow Monitoring Point captures cross-border flows between Niger and Nigeria. Dan Issa is a town near the border with Nigeria through which high flow volumes pass. Migrants often travel towards the Mediterranean sea via Agadez and Libya. The Dan Issa FMP has been active since September 2018. Dan Issa is used mostly by Nigerien and Nigerian traders who have traditionally maintained an economic exchange. Most essential products heading towards Niamey and Maradi region pass through the Dan Issa FMP.

A daily average of 180 individuals passed through the Dan Issa FMP this month with more Incoming flows 1,941 individuals or 57 per cent of the total observed flows and outgoing flows accounted for 1,380 individuals or 41 per cent. All flows observed were recorded to be heading toward Niger or Nigeria. The main cities of departure were Maradi (Niger); Katsina, Kano, Jibia and Magama (Nigeria). A 41 per cent decrease was observed in the daily average of observed individuals compared to the reports of the previous month. This drop in flows is due to the closure of the borders following the appearance of the Covid-19.

The main reasons cited for migrating were **seasonal migration (61%)**, followed by **economic migration (36%)** and short-term local movements (3%).

The nationalities observed crossing the FMP of Dan Issa were Nigerien (85%) and Nigerian (15%) nationals.

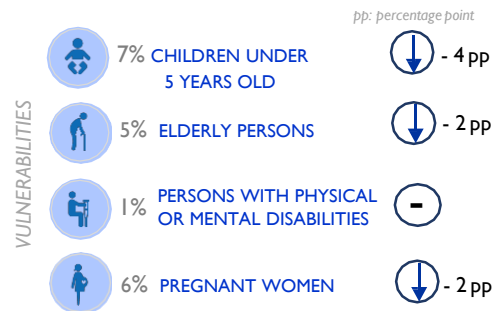

Most individuals were observed travelling by bus (68%) and by private vehicles (32%).

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.

The **Tahoua** Flow Monitoring Point captures both cross-border and internal movements. Tahoua is a city in central Niger, where migrants transit. They mainly originate from Nigeria and other West African countries, such as Mali, Cameroon and Burkina Faso. They tend to take the Agadez route to travel northbound toward Algeria and Libya, while some reach Algeria through Tchintabaraden, about 300 km near the Algerian border. The Tahoua FMP has been **active since August 2018**.

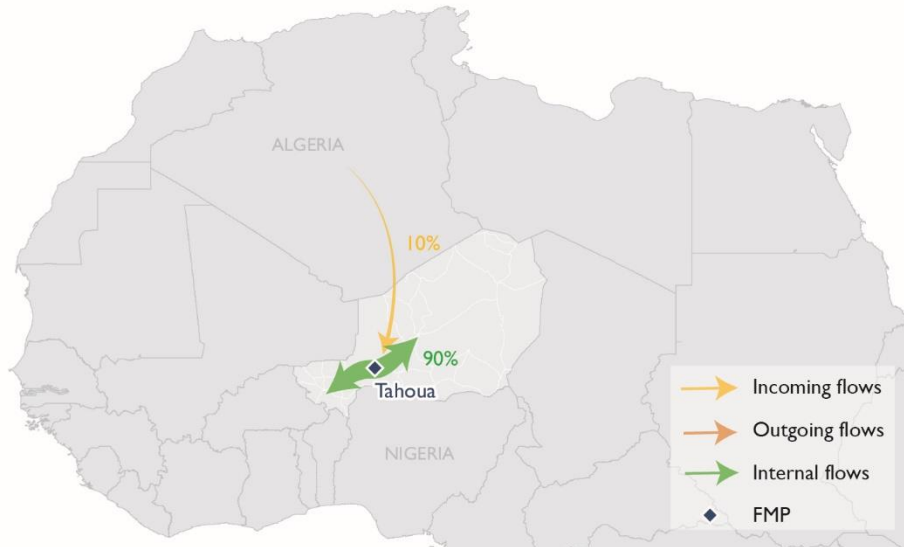

A **daily average of 45 individuals** passing through the Tahoua FMP was observed in April 2020. This represents a decrease of 8 per cent compared to the previous month when an average of 102 individuals were observed crossing the FMP each day. Movements originated mainly from Niamey, Tahoua, Agadez, Arlit, Maradi and Zinder in Niger. The other departure countries included Ivory coast and Algeria.

Most flows observed were internal (90%) which is linked to the fact that the FMP is located in the middle of Niger. Incoming flows represented 10 per cent of flows and outgoing flow 0 per cent .

The main reasons cited for migrating were **short-term local movements (42%)** followed by **seasonal migration (40%)** and **economic migration (18%)**.

The main nationalities observed crossing the Tahoua FMP were Nigerien (90%), Nigerians(3%), Beninese and Burkinabe (2% each) nationals. Other nationalities made up 3 per cent, including nationals from the Côte d'Ivoire, Ghana, Gambia, Senegal, Guinea, Malian and Cameroon.

Most of the individuals observed were travelling by private vehicles (73%) followed by trucks (18%) and bus (9%).

The depiction and use of boundaries, geographic names, and related data shown on maps and included in this report are not warranted to be error free nor do they imply judgment on the legal status of any territory, or any endorsement or acceptance of such boundaries by the IOM.
